REBALANCE

Monthly

STATUS

Descriptive factsheet, not a
registered trial

The claim. Stocks that did best over the past year keep outperforming the worst over the next months. Jegadeesh & Titman (1993) found about 1% a month for US stocks in 1965–1989; Asness, Moskowitz & Pedersen (2013) found it in every major equity market and asset class. **What we find, 2013–2026, point-in-time universes, after costs:** the long/short earned -2.8% to +9.7% a year and was positive in 5 of the six; no universe passes the 2.87 gate. The long-only book (winners) had a higher Sharpe than the equal-weight universe in 5 of the six (US, EU, UK, DK, World), with alphas of +0.5% to +8.8%, passing the gate in UK, World. **What goes wrong (§10):** the main drags are a market bet (average beta -0.33, worth -4.3% a year in 2013–19). None of the pre-declared fixes passes the gate in both windows. **Classification (§11):** Momentum & trend; its returns sit closest to the momentum cluster of the signal library. **360° view (§12):** nearest neighbours Near 52-week high, Above 52-week low; after its closest neighbours and the market it keeps an alpha of -4.5% to +7.3% (largest |t| 2.4), so it carries some information of its own.

1. Headline performance

Universe	Names / groups	L/S return / yr	L/S t	L/S CAPM alpha (t)	L/S beta	Long-only CAGR	Long-only Sharpe	Long-only max DD	EW CAGR	EW Sharpe	Size-weighted CAGR
US	500 / 10	+6.6%	1.38	+10.8% (2.5)	-0.29	+21.4%	1.08	-21%	+14.1%	0.95	+15.3%
EU	238 / 10	+7.0%	1.31	+14.7% (3.0)	-0.67	+14.4%	0.96	-33%	+10.8%	0.78	+10.1%
UK	238 / 10	+9.7%	1.59	+15.8% (2.9)	-0.59	+18.3%	1.15	-28%	+9.9%	0.74	+8.5%
DK	19 / 3	+5.6%	1.20	+10.1% (2.2)	-0.35	+16.7%	1.05	-30%	+12.3%	0.82	+10.3%
SCANDI	62 / 5	-2.8%	-0.71	+1.8% (0.5)	-0.36	+10.9%	0.79	-33%	+12.5%	0.91	+10.7%

Universe	Names / groups	L/S return / yr	L/S t	L/S CAPM alpha (t)	L/S beta	Long-only CAGR	Long-only Sharpe	Long-only max DD	EW CAGR	EW Sharpe	Size-weighted CAGR
World	968 / 10	+7.6%	1.66	+13.7% (3.9)	-0.48	+18.9%	1.10	-26%	+11.9%	0.80	+10.8%

Monthly, local currency (World in USD). L/S = equal-weighted winners (highest 12-1 return) minus losers (lowest 12-1 return), net of 10 bp per side on turnover, a size-tiered borrow fee on the short leg and, where the book is net long cash, financing at the USD risk-free rate + 0.5%. Newey-West t (6 lags). CAPM vs the equal-weight universe. Size-weighted universe = market-cap weights in the US, traded-value weights elsewhere (a proxy for the index).

Momentum on six stock universes, 2013-2026

Growth of 1, log scale, local currency, net of costs. Henrik Gjernerig - Project 10 factsheets

2. Strategy description

Stocks that did best over the past year keep outperforming the worst over the next months. Jegadeesh & Titman (1993) found about 1% a month for US stocks in 1965–1989; Asness, Moskowitz & Pedersen (2013) found it in every major equity market and asset class.

Why it might work. Behavioural: investors under-react to news and then herd (Barberis, Shleifer & Vishny 1998; Hong & Stein 1999); the disposition effect slows the price response (Grinblatt & Han 2005). Risk stories exist but explain little.

Rule	Original (Jegadeesh & Titman (1993))	This factsheet
Signal	Past 3–12 month return; the classic 12-1 skips the latest month	Return from month t–11 to t–1 (skip month t)
Portfolio	Decile or tercile long/short, 1–12 month holding	Extreme quantile L/S, one-month holding, monthly rebalance

Rule	Original (Jegadeesh & Titman (1993))	This factsheet
Weighting	Equal or value weighted	Equal weighted

3. Data load

Universe	Prices	Membership	Names eligible (median)	Currency
US	Sharadar SEP <code>closeadj</code> (total return), 805 tickers incl. delisted	Point-in-time: top 500 by market cap each month-end (Sharadar filings × price, A06 method)	~499	USD
EU	Project1 yfinance cache, Adj Close (TR)	Point-in-time: union of 11 national blue-chip indices (CAC 40, DAX, AEX, IBEX 35, FTSE MIB, OMXS30, OMXC25, OMXH25, BEL 20, PSI-20, WIG20), quarterly Wikipedia snapshots 2012–2026; 83% of member-quarters priced	~238	local (EUR, SEK, DKK, PLN)
UK	Project1 cache, Close + pence dividends (Yahoo under-adjusts LSE ~100×)	Point-in-time: FTSE 100 + FTSE 250, quarterly snapshots; 75% priced	~242	GBP
DK	Project1 cache, Adj Close	Point-in-time: OMX Copenhagen 25, quarterly snapshots; 91% priced	~19	DKK
SCANDI	Project1 cache, Adj Close	Point-in-time: OMXC25 + OMXS30 + OMXH25 (Oslo has no snapshot history); 88% priced	~62	local (DKK, SEK, EUR)
World	US Sharadar + UK + EU above	Point-in-time union of the three; local-currency returns summed, not converted	~963	mixed

Membership comes from Project2's cache of dated Wikipedia index pages (the same parsing as `run_wiki_pit.py` / `run_eu_pit.py`), with a short list of verified ticker renames (e.g. `NZYM-B` → `NSIS-B`, `WDH` → `DEMANT`, `DAI` → `MBG`). A name is eligible from the day after the snapshot that lists it, once it has 60 days of prices. Member-quarters without a price are mostly delisted names that Yahoo no longer serves, so some survivorship remains; see §13.

4. Signal creation

$MOM_{i,t} = P_{i,t-1} / P_{i,t-12} - 1$ on total-return prices; the most recent month is skipped to avoid the one-month reversal. Signals use only information up to month-end t and are traded in month $t+1$. Eligibility: in the point-in-time universe on any of the last five trading days of month t .

5. Model build

- Sort eligible stocks into equal-count groups (deciles ≥ 100 names, quintiles 50–99, terciles < 50 ; fixed per universe).
- Long/short** = winners (highest 12-1 return) minus losers (lowest 12-1 return); **long-only** = winners (highest 12-1 return); benchmarks: equal-weight universe and size-weighted universe.
- Equal weights within each leg, rebalanced monthly.
- Costs: 10 bp per side on the one-way turnover of each leg; short-leg borrow fee 0.25% / 0.75% / 2% a year by size tier (largest 50% / next 30% / smallest 20% of the universe, `code/borrow.py`); net long cash financed at the USD risk-free rate + 0.5%. Code: `code/xs.py` (engine), `code/analyse_xs.py`, `code/build_xs.py`.

6. Performance in detail

9. Statistical verdict

- **Gate:** $|t| > 2.87$ (2 books $\times$ 6 universes, Bonferroni 0.05/12, two-sided).
- **L/S mean:** positive in 5 of the six; passes in 0 of 6.
- **L/S CAPM alpha:** +1.8% to +15.8%, $|t|$ past the gate in 3 of 6.
- **Long-only:** Sharpe above the equal-weight universe in 5 of the six; alpha +0.5% to +8.8%, passing in 2 of 6.
- **Probabilistic Sharpe** of the L/S, $P(\text{true Sharpe} > 0)$: US 0.88, EU 0.88, UK 0.93, DK 0.87, SCANDI 0.25, World 0.92.
- **Publication decay:** gross L/S +1.0% to +18.1% a year in 2013–19 against -3.0% to +12.7% in 2020–26.

10. What goes wrong, and how to fix it

Method. Diagnose on the design window (2013–2019); apply the same pre-declared fix ladder used for every sort strategy in FS03–FS12; judge on the holdout (Jan 2020 – Aug 2026) with a pooled six-universe paired bootstrap of the Sharpe difference against the previous step. 25 fix trials across FS03–FS12, gate $p < 0.0020$.

10.1 Diagnosis (design window 2013–2019)

Universe	L/S gross / yr	Beta	Beta drag / yr	CAPM alpha (gross)	Costs / yr	Long leg vs EW / yr	EW vs short leg / yr	Turnover / month	Worst months
US	+5.7%	-0.30	-4.2%	+9.9%	-1.4%	+2.8%	+2.9%	60%	2015-04 -11%, 2019-09 -9%, 2018-06 -8%
EU	+5.9%	-0.61	-7.1%	+13.0%	-1.3%	+3.1%	+2.8%	54%	2015-02 -12%, 2016-04 -12%, 2016-12 -11%
UK	+18.1%	-0.43	-5.6%	+23.8%	-1.3%	+12.2%	+5.9%	52%	2016-02 -19%, 2016-04 -13%, 2017-02 -11%
DK	+8.6%	-0.02	-0.4%	+8.9%	-0.9%	+5.7%	+2.9%	37%	2018-11 -12%, 2013-08 -10%, 2013-02 -10%
SCANDI	+1.0%	-0.21	-3.2%	+4.3%	-1.2%	+1.9%	-0.8%	49%	2018-11 -14%, 2018-07 -9%, 2019-04 -9%
World	+9.8%	-0.44	-5.4%	+15.2%	-1.4%	+5.4%	+4.5%	57%	2016-04 -9%, 2015-04 -8%, 2016-02 -7%

On average across the six universes the gross spread was +8.2% a year, of which the market exposure (beta -0.33) contributed -4.3%; the beta-adjusted spread (CAPM alpha) was +12.5%. Costs took 1.2% a year at 52% monthly turnover across both legs. The long leg beat the universe by +5.2% and the short leg lagged it by +3.0% a year, so most of the spread comes from the long side. Holding longer does not change the picture much: the gross spread 2, 3 and 6 months after formation averages +7.4%, +7.6%, +6.1% a year.

10.2 The fix ladder

X0 baseline → X1 **beta-neutral legs** (each leg scaled by 1/its ex-ante beta) → X2 + **turnover buffer** (enter the extreme 1/q, keep a name until it leaves the extreme 3/q) → X3 + **volatility targeting** (scale the L/S to 10% a year using its trailing 6-month volatility, lagged; Barroso & Santa-Clara 2015; Moreira & Muir 2017).

Step	Design Sharpe (avg)	Δ design (p)	Holdout Sharpe (book)	Δ holdout (p)	Universes improved	Holdout return / yr	Holdout max DD	Holdout alpha vs EW (t)	Costs / yr
X0 baseline	0.34	—	0.29	—	—	+5.1%	-34%	+11.3% (2.2)	1.2%
X1 beta-neutral legs	0.46	+0.17 (p 0.060)	0.40	+0.11 (p 0.219)	5 of 6	+5.3%	-28%	+8.1% (1.6)	1.3%
X2 + turnover buffer	0.44	-0.02 (p 0.585)	0.45	+0.05 (p 0.324)	4 of 6	+5.2%	-24%	+7.5% (1.7)	0.7%
X3 + volatility targeting	0.40	-0.07 (p 0.581)	0.55	+0.10 (p 0.078)	3 of 6	+5.6%	-18%	+7.5% (2.0)	0.6%

✓ = passes the gate in the holdout. Design Sharpe = average across universes; tests and holdout columns use the six-universe equal-weighted book.

- **X1 beta-neutral legs:** +0.17 design, +0.11 holdout; helps in both windows but does not pass the gate.
- **X2 + turnover buffer:** -0.02 design, +0.05 holdout; helps in one window and hurts in the other: not reliable.
- **X3 + volatility targeting:** -0.07 design, +0.10 holdout; helps in one window and hurts in the other: not reliable.

Where it ends: holdout Sharpe 0.29 → 0.55, return +5.1% → +5.6% a year (six-universe book).

11. Classification: where does it fit?

Dimension	Momentum
Series family	Momentum & trend
Academic style	Cross-sectional momentum (Carhart's UMD, AQR's momentum)
Signal	Price only (daily total returns)
Cross-section vs time series	Cross-sectional: stocks ranked against each other each month
Horizon and turnover	One month; 52% of the two legs replaced monthly
Market exposure	L/S beta -0.67 to -0.29
Payoff shape	Treynor–Mazuy γ -3.60 to 1.07 (t -2.1 to 0.8); worst 10% of market months +1.8% to +4.5% a month, best 10% -4.7% to -2.7%
Nearest factor theme	momentum (3 of 6 universes), WML (2 of 6 universes)
Nearest library signals (returns)	Near 52-week high (6 universes), Above 52-week low (4 universes), Residual momentum (4 universes)

Dimension	Momentum
Economic rationale	Behavioural: investors under-react to news and then herd (Barberis, Shleifer & Vishny 1998; Hong & Stein 1999); the disposition effect slows the price response (Grinblatt & Han 2005). Risk stories exist but explain little.
Publication	Jegadeesh & Titman 1993 (data to 1989); Carhart 1997 factor; known crash risk after market rebounds (Daniel & Moskowitz 2016)
Where it fits	In the momentum cluster of the library; with some information beyond its neighbours.

12. 360° view

The signal among the 19 price signals of the shared library (`code/library.py`), on the same universes and months (equal-weighted top minus bottom quantile, gross). Its natural mirror here is **Last month return**.

Signal (top minus bottom, raw sign)	Cluster	Likeness: stocks	Likeness: returns	Raw L/S, avg of 6	CAPM alpha range	Universes alpha t $\geq +2$ / ≤ -2
Momentum 12-1 (this strategy)	momentum	+1.00	+1.00	+7.7%	+3.9% to +17.8%	5 / 0
Near 52-week high	momentum	+0.57	+0.77	+2.5%	+8.3% to +18.8%	6 / 0

Signal (top minus bottom, raw sign)	Cluster	Likeness: stocks	Likeness: returns	Raw L/S, avg of 6	CAPM alpha range	Universes alpha t $\geq +2$ / ≤ -2
Above 52-week low	momentum	+0.64	+0.65	+8.8%	+4.4% to +13.8%	4 / 0
Residual momentum	momentum	+0.66	+0.63	+6.1%	+7.3% to +13.0%	5 / 0
55-day breakout	momentum	+0.19	+0.54	+0.7%	+5.6% to +12.6%	3 / 0
Volatility	low risk	-0.15	-0.44	+3.0%	-10.3% to -3.7%	0 / 5
MIN5	low risk	+0.10	+0.44	-2.0%	+2.4% to +13.2%	4 / 0
Volatility (252 days)	low risk	-0.12	-0.41	+5.1%	-10.3% to -0.2%	0 / 1
Range (MAX–MIN)	low risk	-0.12	-0.40	+1.2%	-11.3% to -2.3%	0 / 4
Beta	low risk	-0.09	-0.39	+5.5%	-15.7% to -2.6%	0 / 3
MIN (worst day)	low risk	+0.08	+0.38	-1.5%	+2.9% to +11.0%	3 / 0
MAX (best day)	low risk	-0.11	-0.33	+1.9%	-9.3% to +1.0%	0 / 2
Last month return (mirror)	short-term reversal	-0.02	+0.32	+0.9%	-3.2% to +8.4%	0 / 0
Idiosyncratic vol	low risk	-0.10	-0.32	-1.5%	-10.4% to -0.8%	0 / 3
MAX5	low risk	-0.12	-0.30	+2.6%	-8.5% to +0.4%	0 / 2
Size	size	+0.08	+0.25	-1.5%	-3.8% to +4.6%	0 / 0
Same-month seasonality	seasonality	+0.12	+0.11	-1.8%	-8.5% to +7.2%	0 / 0
Skewness	tail direction	-0.04	-0.08	-0.2%	-5.4% to +4.5%	0 / 1
Net tail (MAX+MIN)	tail direction	-0.04	+0.06	-1.0%	-5.3% to +4.2%	0 / 0

Spanning. Regressing the L/S on its five closest library neighbours (by return correlation) and the market:

| Universe | Alpha after neighbours / yr | t | R² | Neighbours with |t| ≥ 2 | ---|---|---|---| | US | -1.0% | -0.47 | 0.87 | Above 52-week low +0.50 (+11.0), Near 52-week high +0.91 (+11.2), Residual momentum +0.15 (+2.3), Size +0.26 (+3.2), 55-day breakout -0.61 (-7.8) | | EU | -4.5% | -1.74 | 0.85 | Near 52-week high +0.78 (+6.1), 55-day breakout -0.46 (-5.3), Residual momentum +0.26 (+3.3), Above 52-week low +0.48 (+5.1) | | UK | +7.3% | 2.37 | 0.77 | Near 52-week high +1.23 (+11.8), 55-day breakout -0.26 (-2.7), MIN5 -0.26 (-2.0) | | DK | +0.7% | 0.27 | 0.76 | Near 52-week high +0.35 (+5.7), Residual momentum +0.41 (+9.8), Above 52-week low +0.40 (+6.0), Volatility -0.16 (-3.0), MIN5 -0.16 (-2.8) | | SCANDI | -3.7% | -1.42 | 0.69 | Near 52-week high +0.54 (+6.1), Residual momentum +0.33 (+5.4), Above 52-week low +0.30 (+3.1) | | World | +1.8% | 1.14 | 0.90 | Near 52-week high +1.04 (+10.0), Above 52-week low +0.42 (+6.9), Residual momentum +0.21 (+3.7), 55-day breakout -0.60 (-9.1) |

3×3 sort, next-month return a year
(US, EU, UK, SCANDI, World averaged)

low Momentum 12-1	11.6%	9.9%	10.1%
middle	11.4%	11.8%	12.6%
high Momentum 12-1	14.0%	14.9%	14.2%
	low Last month return	middle	high Last month return

Holding Last month return fixed (down a column), moving from low to high Momentum 12-1 changes the return by +2.4, +5.0 and +4.1 points a year; holding Momentum 12-1 fixed (along a row), moving from low to high Last month return changes it by -1.4, +1.2 and +0.3. **Market direction.** Top-minus-bottom return in rising vs falling market months (six-universe average): -2% vs +25% a year. **Horizon:** the gross spread at 1, 2, 3 and 6 months after formation averages +7.7%, +7.4%, +7.6%, +6.1% a year.

The full library, with the CAPM alpha of every signal in every universe:

Signal library: CAPM alpha of each top-minus-bottom sort, % a year (t)

13. Caveats

1. **Residual survivorship.** Point-in-time membership everywhere, but 9–25% of member-quarters outside the US have no price (mostly delisted names); long books are flattered and short books penalised by an unknown amount.
2. **Currency.** Local currency; World sums local-currency returns without conversion.
3. **Equal weighting and flat trading costs.** 10 bp per side for every stock and a size-tiered borrow fee, but no market impact; blue-chip universes only.

4. **Not a registered trial.** Descriptive; the fix ladder is counted inside FS03–FS12 (25 trials).
