

Monkey portfolios

Can a blindfolded monkey beat the index?

Monkeys win where small beats big. That's all they know.

Henrik Gjernerig · Project 10 · point-in-time universes, local currency (World in USD)

Burton Malkiel (1973): a blindfolded monkey throwing darts at the stock pages could do as well as the experts.

I let 10,000 monkeys pick 10–30 stocks every January in six markets, 2013–2026, point-in-time index members, after costs.

Share of monkeys that beat the index: US 16%, EU 71%, UK 85%, Denmark 85%, Scandinavia 86%, World 72%.

The monkeys are not lucky or clever. A random portfolio is an equal-weight portfolio, and equal weight is a bet on small companies. They win in the years small beats big and lose when the mega-caps lead, as they did in the US.

The lesson for any stock picker: compare yourself with the equal-weight universe as well as the index, or a size tilt will look like skill.
