

Every signal, every corner

19 price signals × 6 markets + 153 published factors, 2013–2026

Positive in every corner: profit growth, debt issuance.

Henrik Gjernerig · Project 10 · point-in-time universes, local currency (World in USD)

I put every signal in every corner.

19 price signals × 6 markets (US, Europe, UK, Denmark, Scandinavia, World), 2013–2026, point-in-time index members, after costs. Plus the 153 published factors of Jensen, Kelly & Pedersen, by country.

The question: what works everywhere, and not just in one market?

→ After correcting for 38 tests, no price signal earns a positive return that survives on its own. Thirteen years of large caps is too short to prove a single signal.

→ The direction is more consistent than the significance. Momentum is positive in 5 of 6 of my markets and all 4 published segments (t 4.4 there, 1.4 in my large caps after borrow fees).

→ Low beta is positive in 6 of 6, once you remove the market bet and pay for the leverage it needs (2.2× borrowed in the US).

- 19 signals are really two bets: a low-risk block of nine and a momentum block of four.
- In the fundamentals, debt issuance (t 6.2) and profit growth (t 2.5) worked in every segment. Short-term reversal, seasonality, investment and accruals faded in the US.
- Seasonality and skewness lose reliably in large caps (seasonality is the one signal that survives the correction, as a loser).
- Scandinavia marches to its own drum: its ranking of what works has a 0.07 correlation with the other markets.

Engine check: my US signals correlate 0.8 or more with the published factors for 8 of 12.
