

# FACTSHEET FS12 · Buy at the 52-week low

**What changed on 2 October 2026.** Two corrections, both to the universe of stocks, and every number below is re-run on them. (1) **US:** the universe is now the actual S&P 500 members at each month-end. Until now it was the 500 largest of every company that was *ever* in the index 2012–2026, which includes later winners before they joined. (2) **UK and EU:** the price panels now include the index members that stopped trading (UK coverage of members 71% → 92%, EU 81% → 89%); before, most of them had no prices. SCANDI stays as registered (OMXC25 + OMXS30 + OMXH25). Registered verdicts are unchanged; where a corrected number crosses a gate, the text says so. Comparison and method: FACTSHEETS\_RERUN\_2026-10-02.md.

**US, 1999–2012 (pre-registered second period, run 2 October 2026).** The same rules on Sharadar's point-in-time S&P 500 with delisted stocks, 1999–2012, a period this factsheet was not built on. L/S net: t -0.27 (2013–2026: -3.07), same sign, weaker. Long-only alpha vs the equal-weight universe: +1.1% a year, t +0.43 (2013–2026: -2.94), reversed. The 2013–2026 US losses did not repeat; they read as specific to that period. Registered verdicts are unchanged. Pre-registration, method and every result: PREREG\_US\_1999\_2012.md.

Should you buy stocks at their yearly low?

Henrik Gjerming · Rude Investment Consulting · Project 10 sidebar: strategy factsheets · data to 31 August 2026

|                                                                    |                                                                                                      |                                                                            |

**The claim.** Folklore says stocks at their yearly low are bargains: 'buy low'. The academic evidence points the other way: stocks near their lows tend to keep underperforming (George & Hwang 2004), and in the series A10 Free Fallin' found knives rebound only in market-wide crashes. **What we find, 2013–2026, point-in-time universes, after costs:** the long/short earned -14.7% to -5.8% a year and was positive in none of the six; no universe passes the 2.87 gate (significantly negative in US, EU, World). The long-only book (stocks closest to their 52-week low) had a higher Sharpe than the equal-weight universe in none of the six, with alphas of -9.7% to -2.5%, none past the gate. **What goes wrong (§9):** no single dominant drag. None of the pre-declared fixes passes the gate in both windows. **Classification (appendix C):** Reversal & bottom-fishing; its returns sit closest to the momentum cluster of the signal library. **360° view (appendix D):** nearest neighbours Momentum 12-1, Residual momentum; after those neighbours and the market, nothing is left (alpha  $|t| < 2$  everywhere): the signal is redundant.

Layout revised 2 October 2026 (verdict and scorecard, Sharpe anatomy, fit with the other strategies; detail moved to the appendix). No number changed.

# 1. Verdict and scorecard

**Verdict.** Of the 12 registered cells (two books × six universes), **0 pass** the  $|t| > 2.87$  gate and **6 are significantly negative** (L/S US, L/S EU, L/S World, long-only US, long-only EU, long-only World). Programme-wide (772 trials,  $|t| > 3.99$ ): long-only alpha vs EW, EU  $t$  -4.99; long-only alpha vs EW, World  $t$  -4.18. US 1999–2012, a period the factsheet was not built on: L/S  $t$  -0.27, long-only alpha  $t$  +0.43.

| Universe     | L/S $t$           | L/S Sharpe | Long-only alpha $t$ | Long-only Sharpe vs equal-weight | Long-only max DD |

Monthly, local currency (World in USD). L/S = equal-weighted stocks closest to their 52-week low minus stocks furthest above it, net of 10 bp per side on turnover, a size-tiered borrow fee on the short leg and, where the book is net long cash, financing at the USD risk-free rate + 0.5%. Newey-West t (6 lags). CAPM vs the equal-weight universe. Size-weighted universe = market-cap weights in the US, traded-value weights elsewhere (a proxy for the index).

#### Buy at the 52-week low on six stock universes, 2013-2026

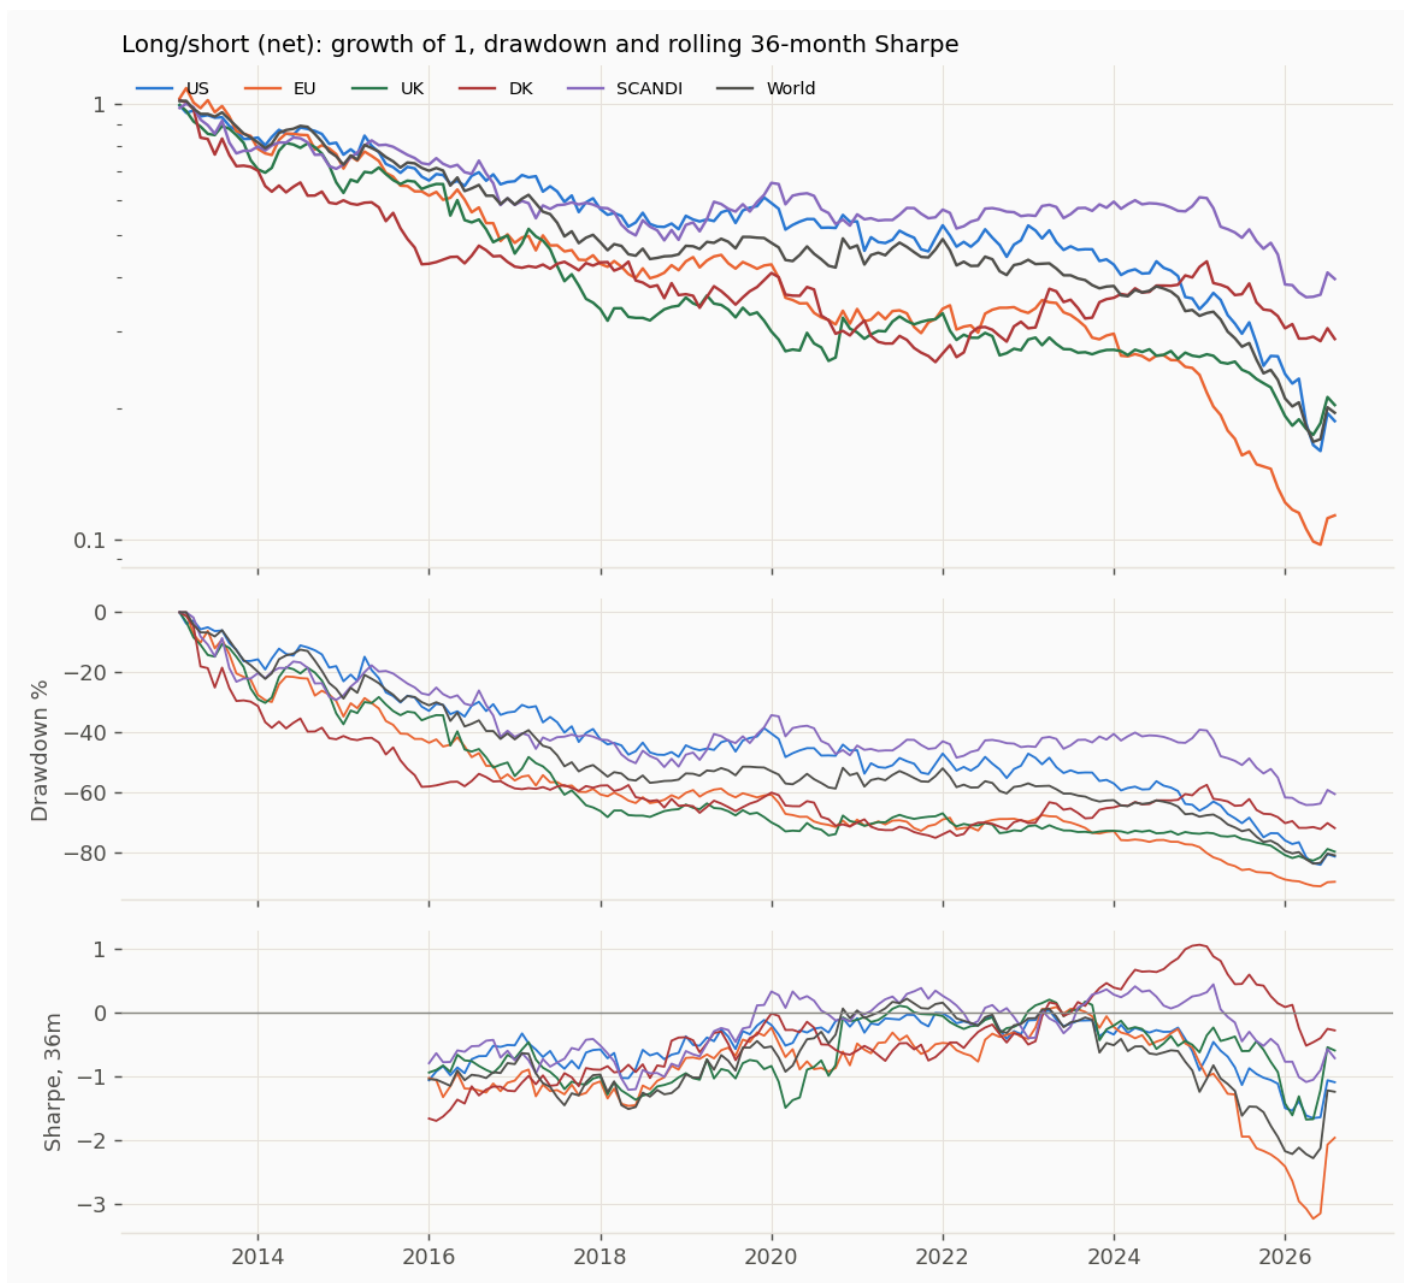

**Read with care.** A long/short book with a negative beta shows a large CAPM alpha in a rising market. The factor-model alpha in section 7, after momentum, value and the other themes, is the better guide: here the L/S CAPM alpha ranges -15.8% to -7.3% and the factor alpha -9.7% to +1.2%.

## 3. Where the Sharpe comes from

Sharpe = annual return ÷ annual volatility. The return splits into the part the market explains (beta × market return) and the rest (alpha, net of costs); the volatility into the market's share and the strategy's own. The last column is the Sharpe the book would have with its market exposure hedged out (before hedging costs).

## 4. How it fits next to the market and the other strategies

A long/short book improves a market portfolio when its own Sharpe beats the hurdle: its correlation with the market  $\times$  the market's Sharpe. A negative correlation makes the hurdle negative, so even a book with a small positive Sharpe diversifies; the size of the gain still depends on that Sharpe.

## 5. Strategy description

Folklore says stocks at their yearly low are bargains: 'buy low'. The academic evidence points the other way: stocks near their lows tend to keep underperforming (George & Hwang 2004), and in the series A10 Free Fallin' found knives rebound only in market-wide crashes.

**Why it might work.** Folklore: mean reversion and value. Evidence: momentum and anchoring (George & Hwang 2004) predict continued weakness; losers carry high beta and volatility.

| Rule      | Original (Market folklore (bottom-fishing); tested against George & Hwang (2004)) | This factsheet                                               |
|-----------|-----------------------------------------------------------------------------------|--------------------------------------------------------------|

*Membership comes from Project2's cache of dated Wikipedia index pages (the same parsing as `run_wiki_pit.py` / `run_eu_pit.py`), with a short list of verified ticker renames (e.g. `NZYM-B` → `NSIS-B`, `WDH` → `DEMANT`, `DAI` → `MBG`). A name is eligible from the day after the snapshot that lists it, once it has 60 days of prices. Member-quarters without a price are mostly delisted names that Yahoo no longer serves, so some survivorship remains; see §13.*

## Signal creation

$LO52_{i,t} = P_{i,t} / \min(P_{i,t-251:t})$ ; the long leg holds the stocks with the lowest value (at the low). Signals use only information up to month-end  $t$  and are traded in month  $t+1$ . Eligibility: in the point-in-time universe on any of the last five trading days of month  $t$ .

## Model build

- Sort eligible stocks into equal-count groups (deciles  $\geq 100$  names, quintiles 50–99, terciles  $< 50$ ; fixed per universe).
- **Long/short** = stocks closest to their 52-week low minus stocks furthest above it; **long-only** = stocks closest to their 52-week low; benchmarks: equal-weight universe and size-weighted universe.
- Equal weights within each leg, rebalanced monthly.
- Costs: 10 bp per side on the one-way turnover of each leg; short-leg borrow fee 0.25% / 0.75% / 2% a year by size tier (largest 50% / next 30% / smallest 20% of the universe, `code/borrow.py`); net long cash financed at the USD risk-free rate + 0.5%. Code: `code/xs.py` (engine), `code/analyse_xs.py`, `code/build_xs.py`.

## 7. Risk and factor attribution

JKP 7 themes (US, UK, DK, World) or French Europe 5F + WML (EU, SCANDI); Newey-West t, 6 lags.

### Long/short

## 8. Statistical detail

- **Gate:** |t| > 2.87 (2 books × 6 universes, Bonferroni 0.05/12, two-sided).
- **L/S mean:** positive in none of the six; passes in 0 of 6.
- **L/S CAPM alpha:** -15.8% to -7.3%, |t| past the gate in 4 of 6.

- **Long-only:** Sharpe above the equal-weight universe in none of the six; alpha -9.7% to -2.5%, passing in 0 of 6.
- **Probabilistic Sharpe** of the L/S,  $P(\text{true Sharpe} > 0)$ : US 0.01, EU 0.00, UK 0.02, DK 0.03, SCANDI 0.07, World 0.01.
- **Publication decay:** gross L/S -12.8% to -3.8% a year in 2013–19 against -15.9% to -1.6% in 2020–26.

## 9. What goes wrong, and how to fix it

**Method.** Diagnose on the design window (2013–2019); apply the same pre-declared fix ladder used for every sort strategy in FSO3–FS12; judge on the holdout (Jan 2020 – Aug 2026) with a pooled six-universe paired bootstrap of the Sharpe difference against the previous step. 25 fix trials across FSO3–FS12, gate  $p < 0.0020$ .

### 9.1 Diagnosis (design window 2013–2019)

| Universe | L/S gross / yr | Beta  | Beta drag / yr | CAPM alpha (gross) | Costs / yr | Long leg vs EW / yr | EW vs short leg / yr | Turnover / month | Worst months                            |
|----------|----------------|-------|----------------|--------------------|------------|---------------------|----------------------|------------------|-----------------------------------------|
| US       | -3.8%          | 0.27  | +3.5%          | -7.4%              | -1.7%      | -1.9%               | -2.0%                | 70%              | 2017-10 -8%, 2017-05 -8%, 2019-08 -7%   |
| EU       | -8.7%          | -0.06 | -0.6%          | -8.1%              | -1.7%      | -5.3%               | -3.5%                | 72%              | 2016-11 -9%, 2016-09 -8%, 2013-10 -7%   |
| UK       | -12.8%         | 0.18  | +2.1%          | -14.9%             | -1.7%      | -1.4%               | -11.4%               | 71%              | 2016-04 -15%, 2016-06 -10%, 2017-01 -9% |
| DK       | -10.9%         | -0.10 | -1.5%          | -9.4%              | -0.9%      | -4.2%               | -6.7%                | 37%              | 2013-05 -14%, 2018-06 -9%, 2015-12 -8%  |
| SCANDI   | -3.8%          | 0.03  | +0.4%          | -4.2%              | -1.3%      | -2.1%               | -1.7%                | 54%              | 2013-09 -11%, 2016-11 -11%, 2017-04 -8% |
| World    | -7.0%          | 0.21  | +2.3%          | -9.3%              | -1.8%      | -3.5%               | -3.5%                | 74%              | 2016-04 -8%, 2017-08 -7%, 2016-06 -7%   |

On average across the six universes the gross spread was -7.8% a year, of which the market exposure (beta +0.09) contributed +1.0%; the beta-adjusted spread (CAPM alpha) was -8.9%. Costs took 1.5% a year at 63% monthly turnover across both legs. The long leg beat the universe by -3.0% and the short leg lagged it by -4.8% a year, so most of the spread comes from the long side. Holding longer does not change the picture much: the gross spread 2, 3 and 6 months after formation averages +9.8%, +9.6%, +8.8% a year.

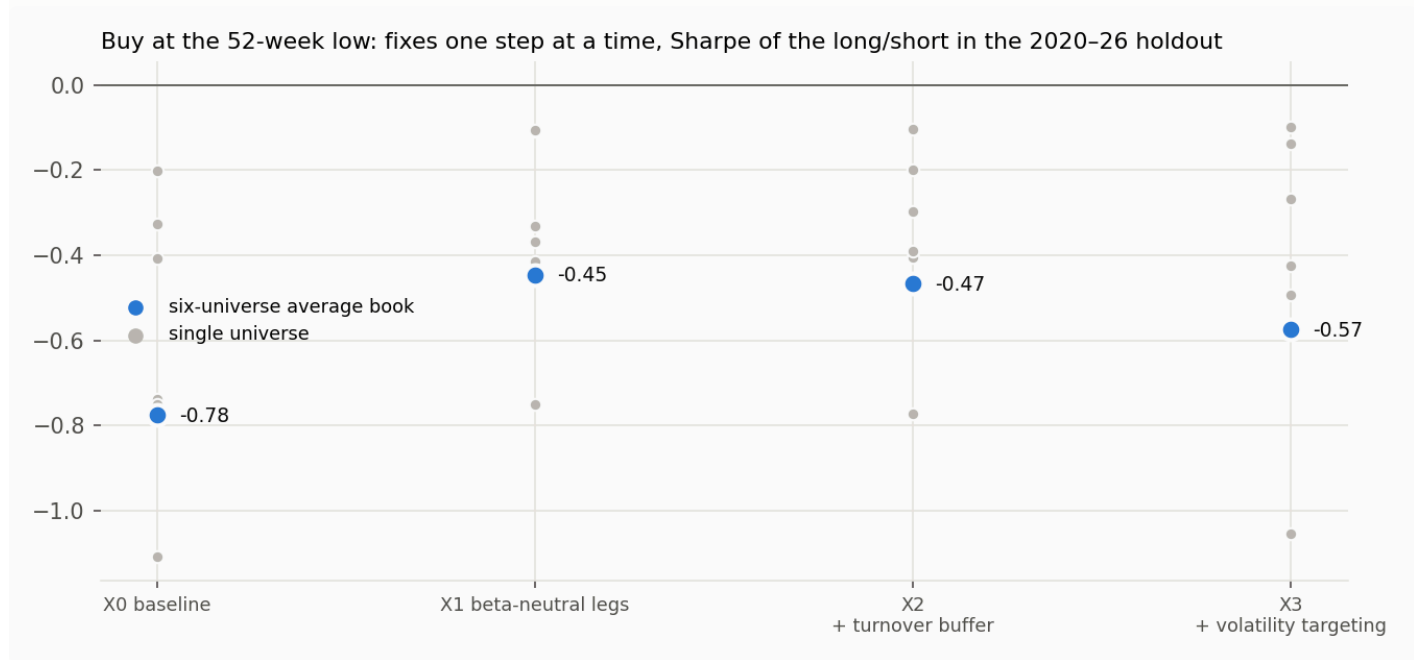

### 9.2 The fix ladder

X0 baseline → X1 **beta-neutral legs** (each leg scaled by  $1/\text{its ex-ante beta}$ ) → X2 + **turnover buffer** (enter the extreme  $1/q$ , keep a name until it leaves the extreme  $3/q$ ) → X3 + **volatility targeting** (scale the L/S to

10% a year using its trailing 6-month volatility, lagged; Barroso & Santa-Clara 2015; Moreira & Muir 2017).

| Step                      | Design Sharpe (avg) | $\Delta$ design (p) | Holdout Sharpe (book) | $\Delta$ holdout (p) | Universes improved | Holdout return / yr | Holdout max DD | Holdout alpha vs EW (t) | Costs / yr |
|---------------------------|---------------------|---------------------|-----------------------|----------------------|--------------------|---------------------|----------------|-------------------------|------------|
| X0 baseline               | -0.72               | –                   | -0.78                 | –                    | –                  | -10.1%              | -57%           | -12.3% (-2.6)           | 1.6%       |
| X1 beta-neutral legs      | -0.58               | +0.18 (p 0.081)     | -0.45                 | +0.33 (p 0.075)      | 6 of 6             | -6.0%               | -52%           | -9.3% (-1.9)            | 1.7%       |
| X2 + turnover buffer      | -0.67               | -0.13 (p 0.908)     | -0.47                 | -0.02 (p 0.547)      | 3 of 6             | -5.1%               | -42%           | -8.0% (-2.0)            | 0.8%       |
| X3 + volatility targeting | -0.56               | +0.17 (p 0.354)     | -0.57                 | -0.11 (p 0.942)      | 3 of 6             | -6.0%               | -43%           | -8.8% (-2.3)            | 0.8%       |

✓ = passes the gate in the holdout. Design Sharpe = average across universes; tests and holdout columns use the six-universe equal-weighted book.

- **X1 beta-neutral legs:** +0.18 design, +0.33 holdout; helps in both windows but does not pass the gate.
- **X2 + turnover buffer:** -0.13 design, -0.02 holdout; hurts in both windows.
- **X3 + volatility targeting:** +0.17 design, -0.11 holdout; helps in one window and hurts in the other: not reliable.

**Where it ends:** holdout Sharpe -0.78 → -0.57, return -10.1% → -6.0% a year (six-universe book).

## 10. Caveats

1. **Residual survivorship.** Point-in-time membership everywhere, but 9–25% of member-quarters outside the US have no price (mostly delisted names); long books are flattered and short books penalised by an unknown amount.
2. **Currency.** Local currency; World sums local-currency returns without conversion.
3. **Equal weighting and flat trading costs.** 10 bp per side for every stock and a size-tiered borrow fee, but no market impact; blue-chip universes only.
4. **Trials.** Every gated cell is in the factsheet trial ledger; the fix ladder is counted inside FS03–FS12 (25 trials).

## C. Classification: where does it fit?

| Dimension                         | Buy at the 52-week low                                                                                                                                        |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Series family                     | <b>Reversal &amp; bottom-fishing</b>                                                                                                                          |
| Academic style                    | Contrarian / bottom-fishing                                                                                                                                   |
| Signal                            | Price only (daily total returns)                                                                                                                              |
| Cross-section vs time series      | <b>Cross-sectional:</b> stocks ranked against each other each month                                                                                           |
| Horizon and turnover              | One month; 63% of the two legs replaced monthly                                                                                                               |
| Market exposure                   | L/S beta 0.09 to 0.30                                                                                                                                         |
| Payoff shape                      | Treynor–Mazuy $\gamma$ -1.14 to 1.93 (t -1.3 to 1.2); worst 10% of market months -2.2% to -0.6% a month, best 10% -0.8% to +1.6%                              |
| Nearest factor theme              | momentum (4 of 6 universes), WML (2 of 6 universes)                                                                                                           |
| Nearest library signals (returns) | Momentum 12-1 (6 universes), Last month return (4 universes), Residual momentum (3 universes)                                                                 |
| Economic rationale                | Folklore: mean reversion and value. Evidence: momentum and anchoring (George & Hwang 2004) predict continued weakness; losers carry high beta and volatility. |
| Publication                       | No academic origin; George & Hwang 2004 as the counter-claim; series A10 (Free Fallin')                                                                       |
| Where it fits                     | In the <b>momentum</b> cluster of the library; fully explained by its neighbours.                                                                             |

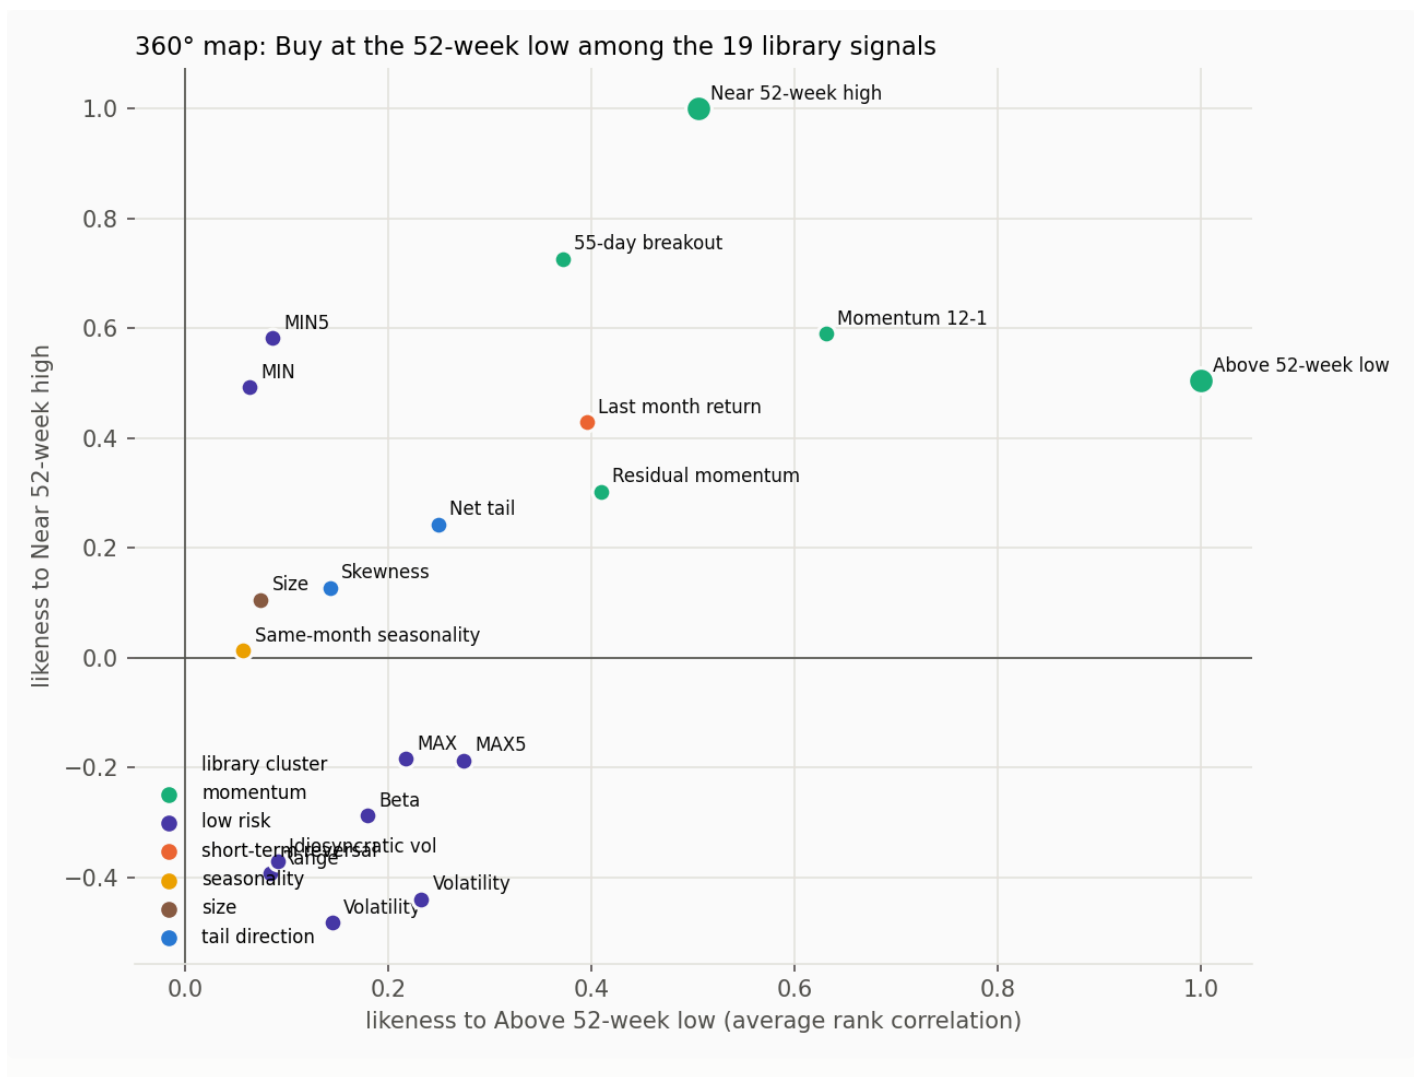

## D. 360° view

The signal among the 19 price signals of the shared library (`code/library.py`), on the same universes and months (equal-weighted top minus bottom quantile, gross). Its natural mirror here is **Near 52-week high**.

| Signal (top minus bottom, raw sign)        | Cluster             | Likeness: stocks | Likeness: returns | Raw L/S, avg of 6 | CAPM alpha range | Universes alpha $t \geq +2 / \leq -2$ |
