

FACTSHEET FS07 · Size

Do smaller companies beat bigger ones?

Henrik Gjerner · Rude Investment Consulting · Project 10 sidebar: strategy factsheets · data to 31 August 2026

STRATEGY	ORIGIN	FAMILY
Size premium (Fama-French SMB)	Banz (1981)	Size
UNIVERSES	BACKTEST	BOOKS
US · EU · UK · DK · SCANDI · World (point-in-time)	Feb 2013 – Aug 2026, monthly, net of costs	Long/short and long-only (smallest names in the universe)
REBALANCE	STATUS	
Monthly	Descriptive factsheet, not a registered trial	

The claim. Small companies earn higher returns than large ones. Banz (1981) found it in US stocks 1936–1975; it became Fama & French's SMB factor, but has been weak since the early 1980s unless junk stocks are controlled for (Asness et al. 2018). **What we find, 2013–2026, point-in-time universes, after costs:** the long/short earned -3.0% to +4.9% a year and was positive in 4 of the six; no universe passes the 2.87 gate. The long-only book (smallest names in the universe) had a higher Sharpe than the equal-weight universe in 1 of the six (UK), with alphas of -2.6% to +5.8%, passing the gate in UK. **What goes wrong (§10):** the main drags are a weaker second half (2020–26). None of the pre-declared fixes passes the gate in both windows. **Classification (§11):** Size; its returns sit closest to the momentum cluster of the signal library. **360° view (§12):** nearest neighbours Near 52-week high, 55-day breakout; after those neighbours and the market, nothing is left (alpha $|t| < 2$ everywhere): the signal is redundant.

1. Headline performance

Universe	Names / groups	L/S return / yr	L/S t	L/S CAPM alpha (t)	L/S beta	Long- only CAGR	Long- only Sharpe	Long- only max DD	EW CAGR	EW Sharpe	Size- weighted CAGR
US	503 / 10	+0.4%	0.17	-5.5% (-1.7)	0.41	+14.3%	0.77	-38%	+14.2%	0.96	+15.3%
EU	236 / 10	-2.2%	-0.64	-3.6% (-1.0)	0.12	+8.4%	0.57	-30%	+10.9%	0.78	+10.1%
UK	242 / 10	+4.9%	1.43	+2.9% (0.7)	0.20	+15.5%	1.06	-26%	+10.0%	0.74	+8.5%

SCANDI	62 / 5	+2.7%	1.07	+1.5% (0.6)	0.09	+14.4%	0.91	-26%	+12.5%	0.91	+10.7%
World	979 / 10	+0.2%	0.07	-3.1% (-1.5)	0.26	+11.7%	0.70	-34%	+12.0%	0.80	+10.8%

Monthly, local currency (World in USD). L/S = equal-weighted smallest names in the universe minus largest names, net of 10 bp per side on turnover, a size-tiered borrow fee on the short leg and, where the book is net long cash, financing at the USD risk-free rate + 0.5%. Newey-West t (6 lags). CAPM vs the equal-weight universe. Size-weighted universe = market-cap weights in the US, traded-value weights elsewhere (a proxy for the index).

Size on six stock universes, 2013-2026

Growth of 1, log scale, local currency, net of costs. Henrik Gjernerig · Project 10 factsheets

2. Strategy description

Small companies earn higher returns than large ones. Banz (1981) found it in US stocks 1936–1975; it became Fama & French's SMB factor, but has been weak since the early 1980s unless junk stocks are controlled for (Asness et al. 2018).

Why it might work. Risk (distress, illiquidity; Fama & French 1993) or mispricing; much of the historical premium came from the smallest, least liquid stocks and January.

Rule	Original (Banz (1981))	This factsheet
Signal	Market capitalisation	US: market cap (Sharadar). Elsewhere: 63-day average traded value (price × volume), a proxy
Portfolio	Size deciles or SMB (2×3)	Extreme quantile L/S within the universe, monthly
Weighting	Value weighted	Equal weighted

3. Data load

Universe	Prices	Membership	Names eligible (median)	Currency
US	Sharadar SEP <code>closeadj</code> (total return), 805 tickers incl. delisted	Point-in-time: top 500 by market cap each month-end (Sharadar filings × price, A06 method)	~499	USD
EU	Project1 yfinance cache, Adj Close (TR)	Point-in-time: union of 11 national blue-chip indices (CAC 40, DAX, AEX, IBEX 35, FTSE MIB, OMXS30, OMXC25, OMXH25, BEL 20, PSI-20, WIG20), quarterly Wikipedia snapshots 2012–2026; 83% of member-quarters priced	~238	local (EUR, SEK, DKK, PLN)
UK	Project1 cache, Close + pence dividends (Yahoo under-adjusts LSE ~100×)	Point-in-time: FTSE 100 + FTSE 250, quarterly snapshots; 75% priced	~242	GBP
DK	Project1 cache, Adj Close	Point-in-time: OMX Copenhagen 25, quarterly snapshots; 91% priced	~19	DKK
SCANDI	Project1 cache, Adj Close	Point-in-time: OMXC25 + OMXS30 + OMXH25 (Oslo has no snapshot history); 88% priced	~62	local (DKK, SEK, EUR)
World	US Sharadar + UK + EU above	Point-in-time union of the three; local-currency returns summed, not converted	~963	mixed

Membership comes from Project2's cache of dated Wikipedia index pages (the same parsing as `run_wiki_pit.py` / `run_eu_pit.py`), with a short list of verified ticker renames (e.g. *NZYM-B* → *NSIS-B*, *WDH* → *DEMANT*, *DAI* → *MBG*). A name is eligible from the day after the snapshot that lists it, once it has 60 days of prices. Member-quarters without a price are mostly delisted names that Yahoo no longer serves, so some survivorship remains; see §13.

- **Data gap:** No shares outstanding outside the US: size is proxied by traded value, which also measures liquidity and turnover.
- **Data gap:** The universes are blue chips; the classic size premium lives in micro and small caps, which are excluded by construction.

4. Signal creation

$SIZE_{i,t} = \log \text{market cap (US) or log 63-day average traded value (elsewhere) at month-end } t$; World ranks within each region first. Signals use only information up to month-end t and are traded in month $t+1$. Eligibility: in the point-in-time universe on any of the last five trading days of month t .

5. Model build

- Sort eligible stocks into equal-count groups (deciles ≥ 100 names, quintiles 50–99, terciles < 50 ; fixed per universe).
- Long/short** = smallest names in the universe minus largest names; **long-only** = smallest names in the universe; benchmarks: equal-weight universe and size-weighted universe.
- Equal weights within each leg, rebalanced monthly.
- Costs: 10 bp per side on the one-way turnover of each leg; short-leg borrow fee 0.25% / 0.75% / 2% a year by size tier (largest 50% / next 30% / smallest 20% of the universe, `code/borrow.py`); net long cash financed at the USD risk-free rate + 0.5%. Code: `code/xs.py` (engine), `code/analyse_xs.py`, `code/build_xs.py`.

6. Performance in detail

US (top 500, point-in-time), median 503 names, 10 groups

9. Statistical verdict

- **Gate:** $|t| > 2.87$ (2 books $\times$ 6 universes, Bonferroni 0.05/12, two-sided).
- **L/S mean:** positive in 4 of the six; passes in 0 of 6.
- **L/S CAPM alpha:** -5.5% to +2.9%, $|t|$ past the gate in 0 of 6.
- **Long-only:** Sharpe above the equal-weight universe in 1 of the six; alpha -2.6% to +5.8%, passing in 1 of 6.
- **Probabilistic Sharpe** of the L/S, $P(\text{true Sharpe} > 0)$: US 0.55, EU 0.26, UK 0.95, DK 0.22, SCANDI 0.82, World 0.53.
- **Publication decay:** gross L/S -3.8% to +18.6% a year in 2013–19 against -7.9% to -1.0% in 2020–26.

10. What goes wrong, and how to fix it

Method. Diagnose on the design window (2013–2019); apply the same pre-declared fix ladder used for every sort strategy in FS03–FS12; judge on the holdout (Jan 2020 – Aug 2026) with a pooled six-universe paired bootstrap of the Sharpe difference against the previous step. 25 fix trials across FS03–FS12, gate $p < 0.0020$.

10.1 Diagnosis (design window 2013–2019)

Universe	L/S gross / yr	Beta	Beta drag / yr	CAPM alpha (gross)	Costs / yr	Long leg vs EW / yr	EW vs short leg / yr	Turnover / month	Worst months
US	+4.4%	0.25	+3.5%	+0.9%	-0.7%	+3.6%	+0.8%	30%	2015-07 -5%, 2015-09 -4%, 2014-09 -4%
EU	-1.9%	-0.01	-0.1%	-1.8%	-0.3%	-0.6%	-1.2%	13%	2014-05 -6%, 2019-02 -4%, 2014-10 -4%
UK	+18.6%	-0.10	-1.4%	+19.9%	-0.4%	+11.4%	+7.2%	16%	2016-06 -6%, 2019-03 -4%, 2016-09 -3%
DK	-3.8%	-0.02	-0.3%	-3.5%	-0.3%	-3.2%	-0.6%	14%	2014-02 -9%, 2019-05 -9%, 2015-02 -8%
SCANDI	+7.3%	0.05	+0.8%	+6.5%	-0.3%	+2.9%	+4.3%	11%	2017-02 -4%, 2018-09 -4%, 2019-04 -4%
World	+5.2%	0.17	+2.2%	+3.0%	-0.5%	+2.6%	+2.6%	22%	2016-06 -3%, 2018-09 -2%, 2014-07 -2%

On average across the six universes the gross spread was +5.0% a year, of which the market exposure (beta +0.06) contributed +0.8%; the beta-adjusted spread (CAPM alpha) was +4.2%. Costs took 0.4% a year at 17% monthly turnover across both legs. The long leg beat the universe by +2.8% and the short leg lagged it by +2.2% a year, so most of the spread

comes from the long side. Holding longer does not change the picture much: the gross spread 2, 3 and 6 months after formation averages -1.3%, -1.9%, -2.1% a year.

10.2 The fix ladder

X0 baseline → X1 **beta-neutral legs** (each leg scaled by 1/its ex-ante beta) → X2 + **turnover buffer** (enter the extreme 1/q, keep a name until it leaves the extreme 3/q) → X3 + **volatility targeting** (scale the L/S to 10% a year using its trailing 6-month volatility, lagged; Barroso & Santa-Clara 2015; Moreira & Muir 2017).

Step	Design Sharpe (avg)	Δ design (p)	Holdout Sharpe (book)	Δ holdout (p)	Universes improved	Holdout return / yr	Holdout max DD	Holdout alpha vs EW (t)	Costs / yr
X0 baseline	0.55	—	-0.44	—	—	-3.4%	-28%	-6.2% (-2.2)	0.4%
X1 beta-neutral legs	0.65	+0.38 (p 0.029)	-0.66	-0.23 (p 0.979)	1 of 6	-5.4%	-35%	-7.6% (-2.4)	0.5%
X2 + turnover buffer	0.69	+0.06 (p 0.379)	-0.25	+0.41 (p 0.061)	5 of 6	-1.4%	-17%	-2.6% (-1.2)	0.2%
X3 + volatility targeting	0.63	-0.22 (p 0.718)	-0.45	-0.20 (p 0.963)	1 of 6	-3.7%	-24%	-5.9% (-1.7)	0.1%

✓ = passes the gate in the holdout. Design Sharpe = average across universes; tests and holdout columns use the six-universe equal-weighted book.

- **X1 beta-neutral legs:** +0.38 design, -0.23 holdout; helps in one window and hurts in the other: not reliable.
- **X2 + turnover buffer:** +0.06 design, +0.41 holdout; helps in both windows but does not pass the gate.
- **X3 + volatility targeting:** -0.22 design, -0.20 holdout; hurts in both windows.

Where it ends: holdout Sharpe -0.44 → -0.45, return -3.4% → -3.7% a year (six-universe book).

11. Classification: where does it fit?

Dimension	Size
Series family	Size
Academic style	Size premium (Fama-French SMB)
Signal	Price only (daily total returns)
Cross-section vs time series	Cross-sectional : stocks ranked against each other each month
Horizon and turnover	One month; 17% of the two legs replaced monthly
Market exposure	L/S beta 0.08 to 0.41
Payoff shape	Treynor–Mazuy γ -2.04 to 1.84 (t -2.0 to 1.1); worst 10% of market months -2.5% to -0.4% a month, best 10% -0.5% to +2.6%
Nearest factor theme	mkt (2 of 6 universes), HML (1 of 6 universes)
Nearest library signals (returns)	Near 52-week high (3 universes), 55-day breakout (3 universes), Momentum 12-1 (2 universes)
Economic rationale	Risk (distress, illiquidity; Fama & French 1993) or mispricing; much of the historical premium came from the smallest, least liquid stocks and January.
Publication	Banz 1981; Fama & French 1992–93; 'Is size dead?' (van Dijk 2011); 'Size matters, if you control your junk' (Asness et al. 2018)
Where it fits	In the momentum cluster of the library; fully explained by its neighbours.

12. 360° view

The signal among the 19 price signals of the shared library (`code/library.py`), on the same universes and months (equal-weighted top minus bottom quantile, gross). Its natural mirror here is **Idiosyncratic vol.**

Signal (top minus bottom, raw sign)	Cluster	Likeness: stocks	Likeness: returns	Raw L/S, avg of 6	CAPM alpha range	Universes alpha t $\geq +2$ / ≤ -2
Size (this strategy)	size	+1.00	+1.00	-1.5%	-3.8% to +4.6%	0 / 0
Near 52-week high	momentum	+0.07	+0.31	+2.5%	+8.3% to +18.8%	6 / 0
55-day breakout	momentum	+0.04	+0.27	+0.7%	+5.6% to +12.6%	3 / 0
Momentum 12-1	momentum	+0.08	+0.25	+7.7%	+3.9% to +17.8%	5 / 0
Volatility (252 days)	low risk	-0.05	-0.24	+5.1%	-10.3% to -0.2%	0 / 1
MIN5	low risk	+0.02	+0.23	-2.0%	+2.4% to +13.2%	4 / 0

Signal (top minus bottom, raw sign)	Cluster	Likeness: stocks	Likeness: returns	Raw L/S, avg of 6	CAPM alpha range	Universes alpha t $\geq +2$ / ≤ -2
MIN (worst day)	low risk	+0.01	+0.22	-1.5%	+2.9% to +11.0%	3 / 0
Volatility	low risk	-0.02	-0.22	+3.0%	-10.3% to -3.7%	0 / 5
Last month return	short-term reversal	+0.02	+0.21	+0.9%	-3.2% to +8.4%	0 / 0
Beta	low risk	+0.04	-0.21	+5.5%	-15.7% to -2.6%	0 / 3
Range (MAX–MIN)	low risk	+0.00	-0.20	+1.2%	-11.3% to -2.3%	0 / 4
Idiosyncratic vol (mirror)	low risk	-0.01	-0.19	-1.5%	-10.4% to -0.8%	0 / 3
MAX (best day)	low risk	+0.01	-0.14	+1.9%	-9.3% to +1.0%	0 / 2
MAX5	low risk	+0.01	-0.14	+2.6%	-8.5% to +0.4%	0 / 2
Above 52-week low	momentum	+0.05	+0.14	+8.8%	+4.4% to +13.8%	4 / 0
Net tail (MAX+MIN)	tail direction	+0.01	+0.12	-1.0%	-5.3% to +4.2%	0 / 0
Residual momentum	momentum	+0.01	+0.11	+6.1%	+7.3% to +13.0%	5 / 0
Same-month seasonality	seasonality	+0.07	+0.02	-1.8%	-8.5% to +7.2%	0 / 0
Skewness	tail direction	-0.00	-0.01	-0.2%	-5.4% to +4.5%	0 / 1

Spanning. Regressing the L/S on its five closest library neighbours (by return correlation) and the market:

Universe	Alpha after neighbours / yr	t	R ²	Neighbours with $ t \geq 2$
US	+0.8%	0.32	0.53	Momentum 12-1 +0.23 (+3.6)
EU	-1.5%	-0.47	0.15	
UK	-2.1%	-0.61	0.12	Same-month seasonality -0.15 (-3.1)
DK	+1.6%	0.45	0.15	Momentum 12-1 +0.29 (+2.1), Residual momentum -0.15 (-2.0)
SCANDI	+0.9%	0.32	0.12	Net tail +0.19 (+2.3), Same-month seasonality -0.20 (-2.4)
World	+1.1%	0.58	0.43	

3×3 sort, next-month return a year
(US, EU, UK, SCANDI, World averaged)

low Size	12.8%	13.7%	13.3%
middle	11.5%	13.4%	12.5%
high Size	12.2%	12.1%	10.9%
	low Idiosyncratic vol	middle	high Idiosyncratic vol

Holding Idiosyncratic vol fixed (down a column), moving from low to high Size changes the return by -0.6, -1.6 and -2.4 points a year; holding Size fixed (along a row), moving from low to high Idiosyncratic vol changes it by +0.5, +1.0 and -1.3.

Market direction. Top-minus-bottom return in rising vs falling market months (six-universe average): -6% vs +7% a year.

Horizon: the gross spread at 1, 2, 3 and 6 months after formation averages -1.5%, -1.3%, -1.9%, -2.1% a year.

The full library, with the CAPM alpha of every signal in every universe:

Signal library: CAPM alpha of each top-minus-bottom sort, % a year (t)

13. Caveats

1. **Residual survivorship.** Point-in-time membership everywhere, but 9–25% of member-quarters outside the US have no price (mostly delisted names); long books are flattered and short books penalised by an unknown amount.
2. **Currency.** Local currency; World sums local-currency returns without conversion.
3. **Equal weighting and flat trading costs.** 10 bp per side for every stock and a size-tiered borrow fee, but no market impact; blue-chip universes only.

4. **Data gap.** No shares outstanding outside the US: size is proxied by traded value, which also measures liquidity and turnover.
5. **Data gap.** The universes are blue chips; the classic size premium lives in micro and small caps, which are excluded by construction.
6. **Not a registered trial.** Descriptive; the fix ladder is counted inside FS03–FS12 (25 trials).
