

Same-month seasonality

Do stocks repeat their best calendar month?

Long/short positive in 1 of six markets; long-only beat owning all stocks in 1 of six.

Henrik Gjernerig · Project 10 · point-in-time universes, local currency (World in USD)

A stock that did well relative to others in, say, March tends to do well again in March in later years, at annual lags up to 20 years. Heston & Sadka (2008) found it in US stocks 1965–2002; Keloharju, Linnainmaa & Nyberg (2016) found the same across markets and asset classes.

I tested it on six markets, 2013–2026: US, Europe, UK, Denmark, Scandinavia and the world. Point-in-time index members, after costs.

Long/short (stocks with the highest past returns in the coming calendar month minus stocks with the lowest): -14.0% to +3.4% a year, positive in 1 of six markets. Adjusted for market beta: -13.5% to +2.0%.

Long-only (stocks with the highest past returns in the coming calendar month): a better Sharpe than owning all the stocks equally in 1 of six markets.

The pre-declared fixes (beta-neutral legs, a turnover buffer, volatility targeting) took the 2020–26 holdout Sharpe from -0.89 to -0.68.

360° view: it keeps some information beyond its nearest neighbours.
