

FACTSHEET FS12 · Buy at the 52-week low

What changed on 2 October 2026. Two corrections, both to the universe of stocks, and every number below is re-run on them. (1) **US:** the universe is now the actual S&P 500 members at each month-end. Until now it was the 500 largest of every company that was *ever* in the index 2012–2026, which includes later winners before they joined. (2) **UK and EU:** the price panels now include the index members that stopped trading (UK coverage of members 71% → 92%, EU 81% → 89%); before, most of them had no prices. SCANDI stays as registered (OMXC25 + OMXS30 + OMXH25). Registered verdicts are unchanged; where a corrected number crosses a gate, the text says so. Comparison and method: FACTSHEETS_RERUN_2026-10-02.md.

Should you buy stocks at their yearly low?

Henrik Gjerming · Rude Investment Consulting · Project 10 sidebar: strategy factsheets · data to 31 August 2026

STRATEGY	ORIGIN	FAMILY
Contrarian / bottom-fishing	Market folklore (bottom-fishing); tested against George & Hwang (2004)	Reversal & bottom-fishing
UNIVERSES	BACKTEST	BOOKS
US · EU · UK · DK · SCANDI · World (point-in-time)	Feb 2013 – Aug 2026, monthly, net of costs	Long/short and long-only (stocks closest to their 52-week low)
REBALANCE	STATUS	
Monthly	Descriptive factsheet, not a registered trial	

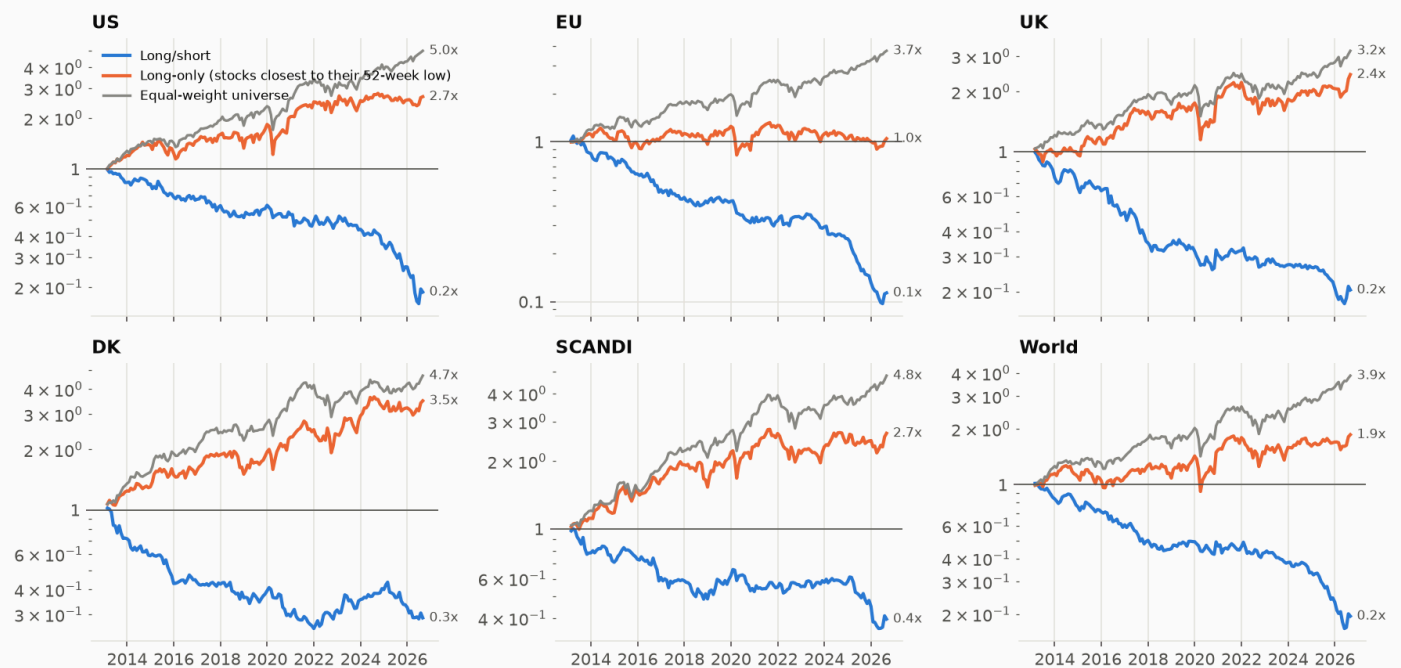

The claim. Folklore says stocks at their yearly low are bargains: 'buy low'. The academic evidence points the other way: stocks near their lows tend to keep underperforming (George & Hwang 2004), and in the series A10 Free Fallin' found knives rebound only in market-wide crashes. **What we find, 2013–2026, point-in-time universes, after costs:** the long/short earned -14.7% to -5.8% a year and was positive in none of the six; no universe passes the 2.87 gate (significantly negative in US, EU, World). The long-only book (stocks closest to their 52-week low) had a higher Sharpe than the equal-weight universe in none of the six, with alphas of -9.7% to -2.5%, none past the gate. **What goes wrong (§10):** no single dominant drag. None of the pre-declared fixes passes the gate in both windows. **Classification (§11):** Reversal & bottom-fishing; its returns sit closest to the momentum cluster of the signal library. **360° view (§12):** nearest neighbours Momentum 12-1, Residual momentum; after those neighbours and the market, nothing is left ($\alpha |t| < 2$ everywhere): the signal is redundant.

1. Headline performance

Universe	Names / groups	L/S return / yr	L/S t	L/S CAPM alpha (t)	L/S beta	Long-only CAGR	Long-only Sharpe	Long-only max DD	EW CAGR	EW Sharpe	Size-weighted CAGR

Monthly, local currency (World in USD). L/S = equal-weighted stocks closest to their 52-week low minus stocks furthest above it, net of 10 bp per side on turnover, a size-tiered borrow fee on the short leg and, where the book is net long cash, financing at the USD risk-free rate + 0.5%. Newey-West t (6 lags). CAPM vs the equal-weight universe. Size-weighted universe = market-cap weights in the US, traded-value weights elsewhere (a proxy for the index).

Buy at the 52-week low on six stock universes, 2013-2026

Growth of 1, log scale, local currency, net of costs. Henrik Gjering · Project 10 factsheets

2. Strategy description

Folklore says stocks at their yearly low are bargains: 'buy low'. The academic evidence points the other way: stocks near their lows tend to keep underperforming (George & Hwang 2004), and in the series A10 Free Fallin' found knives rebound only in market-wide crashes.

Why it might work. Folklore: mean reversion and value. Evidence: momentum and anchoring (George & Hwang 2004) predict continued weakness; losers carry high beta and volatility.

Rule	Original (Market folklore (bottom-fishing); tested against George & Hwang (2004))	This factsheet
Signal	Folklore: buy at or near the 52-week low	Total-return price / 252-day low; lowest = at the low
Portfolio	No standard rule	Extreme quantile L/S (at the low minus far above), one month
Weighting	—	Equal weighted

3. Data load

Universe	Prices	Membership	Names eligible (median)	Currency
US	Sharadar SEP ccloseadj (total return), 805 tickers incl. delisted	Point-in-time: the S&P 500 members at each month-end (Sharadar add/remove history; corrected 2 Oct 2026)	~503	USD
EU	Project1 yfinance cache, Adj Close (TR)	Point-in-time: union of 11 national blue-chip indices (CAC 40, DAX, AEX, IBEX 35, FTSE MIB, OMXS30, OMXC25, OMXH25, BEL 20, PSI-20, WIG20), quarterly Wikipedia snapshots 2012–2026; 83% of member-quarters priced	~238	local (EUR, SEK, DKK, PLN)
UK	Project1 cache, Close + pence dividends (Yahoo under-adjusts LSE ~100×)	Point-in-time: FTSE 100 + FTSE 250, quarterly snapshots; 75% priced	~242	GBP
DK	Project1 cache, Adj Close	Point-in-time: OMX Copenhagen 25, quarterly snapshots; 91% priced	~19	DKK
SCANDI	Project1 cache, Adj Close	Point-in-time: OMXC25 + OMXS30 + OMXH25 (Oslo has no snapshot history); 88% priced	~62	local (DKK, SEK, EUR)
World	US Sharadar + UK + EU above	Point-in-time union of the three; local-currency returns summed, not converted	~963	mixed

Membership comes from Project2's cache of dated Wikipedia index pages (the same parsing as run_wiki_pit.py / run_eu_pit.py), with a short list of verified ticker renames (e.g. NZYM-B → NSIS-B, WDH → DEMANT, DAI → MBG). A name is eligible from the day after the snapshot that lists it, once it has 60 days of prices. Member-

quarters without a price are mostly delisted names that Yahoo no longer serves, so some survivorship remains; see §13.

4. Signal creation

$LO52_{i,t} = P_{i,t} / \min(P_{i,t-251..t})$; the long leg holds the stocks with the lowest value (at the low). Signals use only information up to month-end t and are traded in month $t+1$. Eligibility: in the point-in-time universe on any of the last five trading days of month t .

5. Model build

- Sort eligible stocks into equal-count groups (deciles ≥ 100 names, quintiles 50–99, terciles < 50 ; fixed per universe).
- **Long/short** = stocks closest to their 52-week low minus stocks furthest above it; **long-only** = stocks closest to their 52-week low; benchmarks: equal-weight universe and size-weighted universe.
- Equal weights within each leg, rebalanced monthly.
- Costs: 10 bp per side on the one-way turnover of each leg; short-leg borrow fee 0.25% / 0.75% / 2% a year by size tier (largest 50% / next 30% / smallest 20% of the universe, `code/borrow.py`); net long cash financed at the USD risk-free rate + 0.5%. Code: `code/xs.py` (engine), `code/analyse_xs.py`, `code/build_xs.py`.

9. Statistical verdict

- **Gate:** $|t| > 2.87$ (2 books $\times$ 6 universes, Bonferroni 0.05/12, two-sided).
- **L/S mean:** positive in none of the six; passes in 0 of 6.
- **L/S CAPM alpha:** -15.8% to -7.3%, $|t|$ past the gate in 4 of 6.
- **Long-only:** Sharpe above the equal-weight universe in none of the six; alpha -9.7% to -2.5%, passing in 0 of 6.
- **Probabilistic Sharpe** of the L/S, $P(\text{true Sharpe} > 0)$: US 0.01, EU 0.00, UK 0.02, DK 0.03, SCANDI 0.07, World 0.01.
- **Publication decay:** gross L/S -12.8% to -3.8% a year in 2013–19 against -15.9% to -1.6% in 2020–26.

10. What goes wrong, and how to fix it

Method. Diagnose on the design window (2013–2019); apply the same pre-declared fix ladder used for every sort strategy in FS03–FS12; judge on the holdout (Jan 2020 – Aug 2026) with a pooled six-universe paired bootstrap of the Sharpe difference against the previous step. 25 fix trials across FS03–FS12, gate $p < 0.0020$.

10.1 Diagnosis (design window 2013–2019)

Universe	L/S gross / yr	Beta	Beta drag / yr	CAPM alpha (gross)	Costs / yr	Long leg vs EW / yr	EW vs short leg / yr	Turnover / month	Worst months
US	-3.8%	0.27	+3.5%	-7.4%	-1.7%	-1.9%	-2.0%	70%	2017-10 -8%, 2017-05 -8%, 2019-08 -7%
EU	-8.7%	-0.06	-0.6%	-8.1%	-1.7%	-5.3%	-3.5%	72%	2016-11 -9%, 2016-09 -8%, 2013-10 -7%
UK	-12.8%	0.18	+2.1%	-14.9%	-1.7%	-1.4%	-11.4%	71%	2016-04 -15%, 2016-06 -10%, 2017-01 -9%
DK	-10.9%	-0.10	-1.5%	-9.4%	-0.9%	-4.2%	-6.7%	37%	2013-05 -14%, 2018-06 -9%, 2015-12 -8%
SCANDI	-3.8%	0.03	+0.4%	-4.2%	-1.3%	-2.1%	-1.7%	54%	2013-09 -11%, 2016-11 -11%, 2017-04 -8%
World	-7.0%	0.21	+2.3%	-9.3%	-1.8%	-3.5%	-3.5%	74%	2016-04 -8%, 2017-08 -7%, 2016-06 -7%

On average across the six universes the gross spread was -7.8% a year, of which the market exposure (beta +0.09) contributed +1.0%; the beta-adjusted spread (CAPM alpha) was -8.9%. Costs took 1.5% a year at 63% monthly turnover across both legs. The long leg beat the universe by -3.0% and the short leg lagged it by -4.8% a

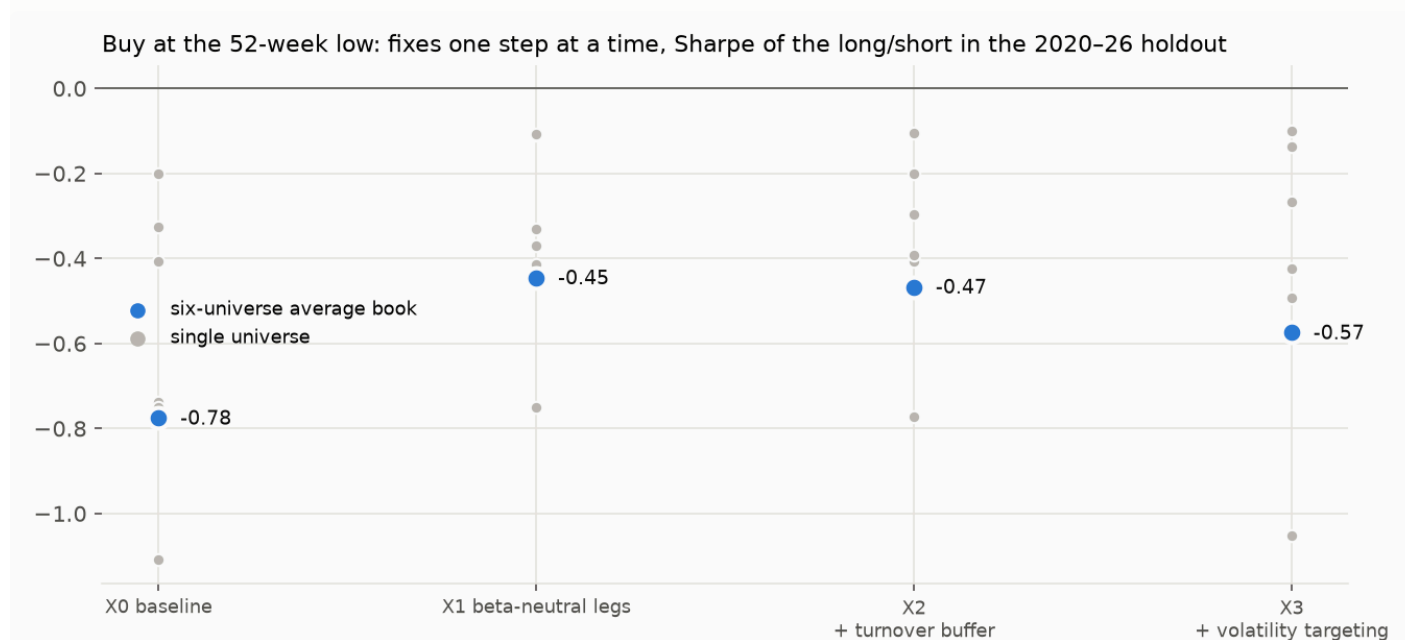

year, so most of the spread comes from the long side. Holding longer does not change the picture much: the gross spread 2, 3 and 6 months after formation averages +9.8%, +9.6%, +8.8% a year.

10.2 The fix ladder

X0 baseline → X1 **beta-neutral legs** (each leg scaled by 1/its ex-ante beta) → X2 + **turnover buffer** (enter the extreme 1/q, keep a name until it leaves the extreme 3/q) → X3 + **volatility targeting** (scale the L/S to 10% a year using its trailing 6-month volatility, lagged; Barroso & Santa-Clara 2015; Moreira & Muir 2017).

Step	Design Sharpe (avg)	Δ design (p)	Holdout Sharpe (book)	Δ holdout (p)	Universes improved	Holdout return / yr	Holdout max DD	Holdout alpha vs EW (t)	Costs / yr
X0 baseline	-0.72	–	-0.78	–	–	-10.1%	-57%	-12.3% (-2.6)	1.6%
X1 beta-neutral legs	-0.58	+0.18 (p 0.081)	-0.45	+0.33 (p 0.075)	6 of 6	-6.0%	-52%	-9.3% (-1.9)	1.7%
X2 + turnover buffer	-0.67	-0.13 (p 0.908)	-0.47	-0.02 (p 0.547)	3 of 6	-5.1%	-42%	-8.0% (-2.0)	0.8%
X3 + volatility targeting	-0.56	+0.17 (p 0.354)	-0.57	-0.11 (p 0.942)	3 of 6	-6.0%	-43%	-8.8% (-2.3)	0.8%

✓ = passes the gate in the holdout. Design Sharpe = average across universes; tests and holdout columns use the six-universe equal-weighted book.

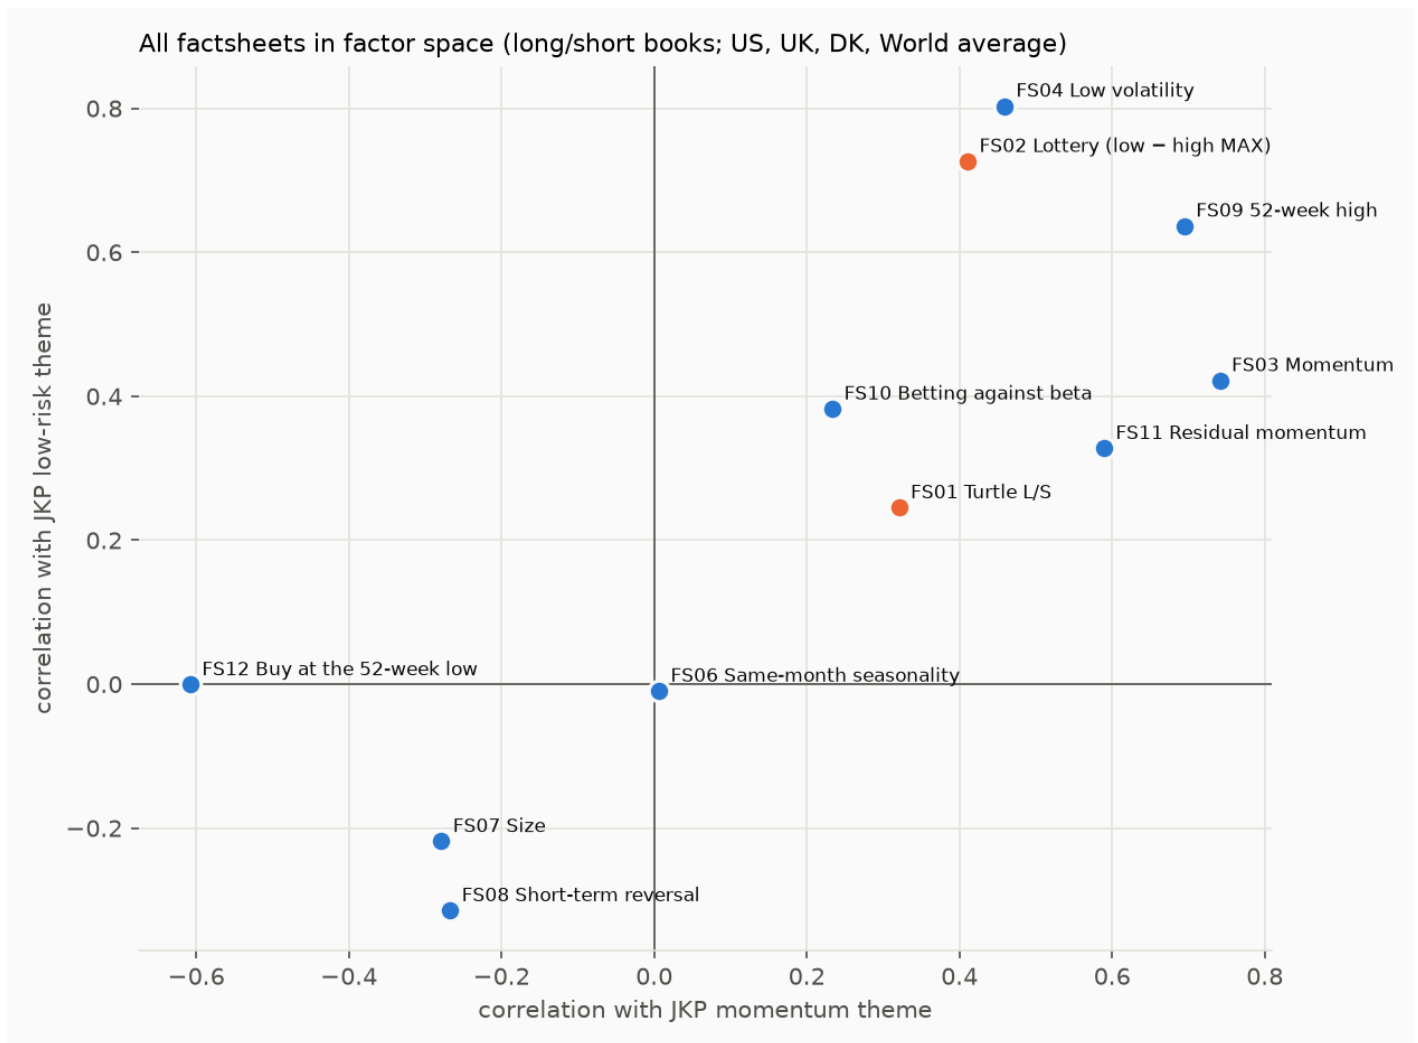

- **X1 beta-neutral legs:** +0.18 design, +0.33 holdout; helps in both windows but does not pass the gate.
- **X2 + turnover buffer:** -0.13 design, -0.02 holdout; hurts in both windows.
- **X3 + volatility targeting:** +0.17 design, -0.11 holdout; helps in one window and hurts in the other: not reliable.

Where it ends: holdout Sharpe -0.78 → -0.57, return -10.1% → -6.0% a year (six-universe book).

11. Classification: where does it fit?

Dimension	Buy at the 52-week low
Series family	Reversal & bottom-fishing
Academic style	Contrarian / bottom-fishing
Signal	Price only (daily total returns)
Cross-section vs time series	Cross-sectional: stocks ranked against each other each month
Horizon and turnover	One month; 63% of the two legs replaced monthly
Market exposure	L/S beta 0.09 to 0.30
Payoff shape	Treynor–Mazuy γ -1.14 to 1.93 (t -1.3 to 1.2); worst 10% of market months -2.2% to -0.6% a month, best 10% -0.8% to +1.6%
Nearest factor theme	momentum (4 of 6 universes), WML (2 of 6 universes)
Nearest library signals (returns)	Momentum 12-1 (6 universes), Last month return (4 universes), Residual momentum (3 universes)
Economic rationale	Folklore: mean reversion and value. Evidence: momentum and anchoring (George & Hwang 2004) predict continued weakness; losers carry high beta and volatility.
Publication	No academic origin; George & Hwang 2004 as the counter-claim; series A10 (Free Fallin')
Where it fits	In the momentum cluster of the library; fully explained by its neighbours.

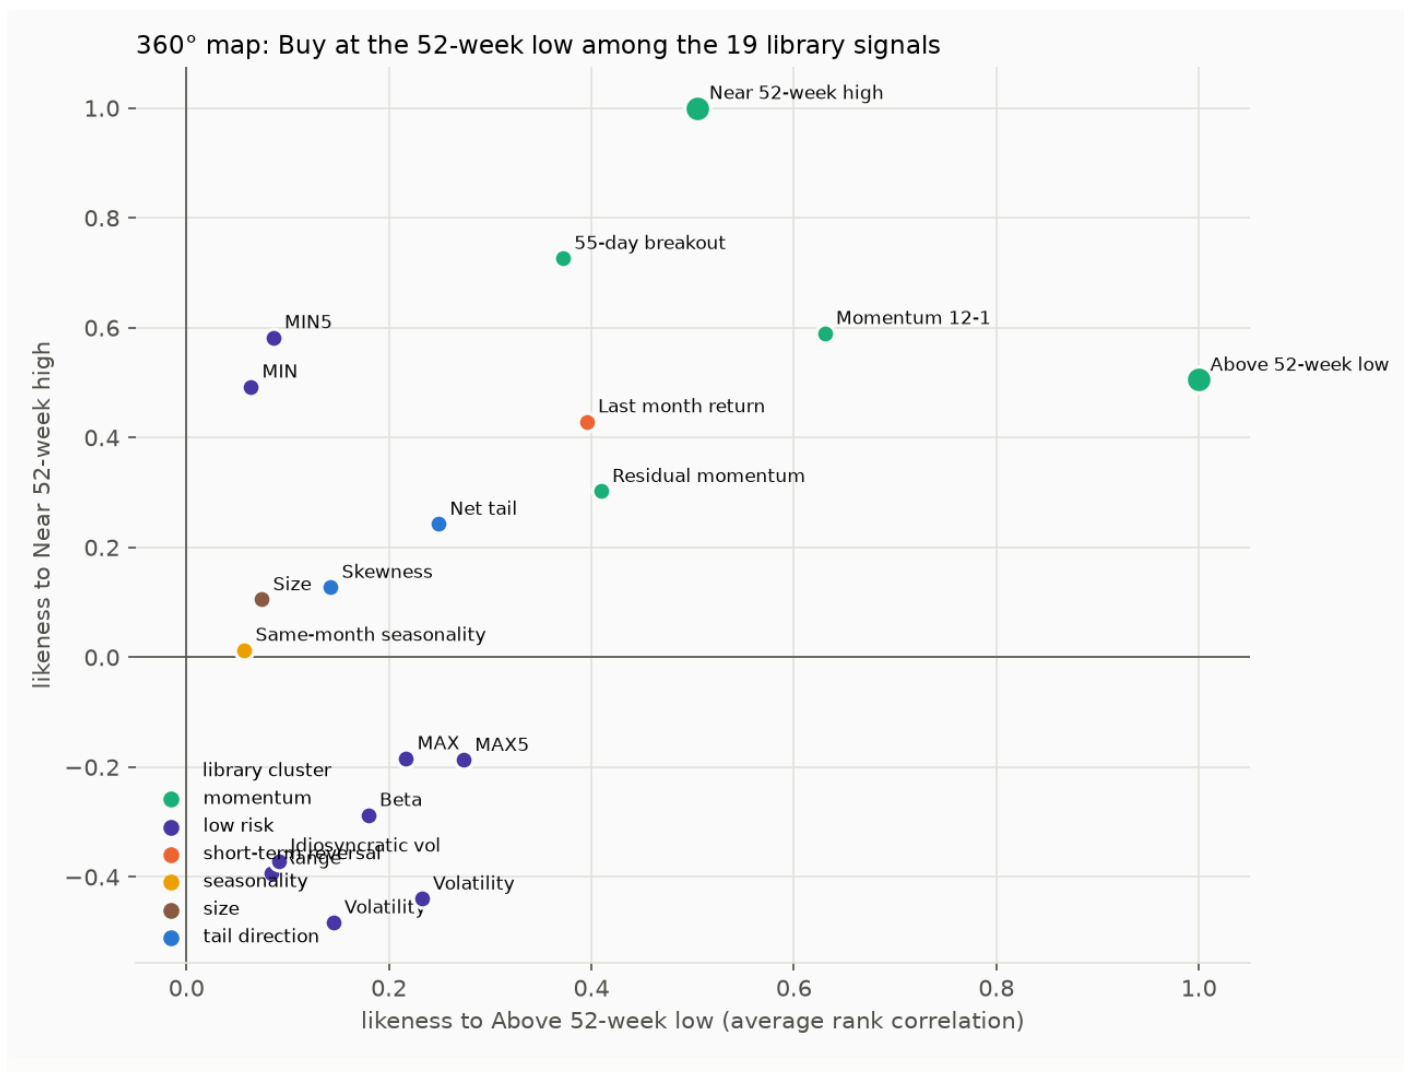

12. 360° view

The signal among the 19 price signals of the shared library (`code/library.py`), on the same universes and months (equal-weighted top minus bottom quantile, gross). Its natural mirror here is **Near 52-week high**.

Signal (top minus bottom, raw sign)	Cluster	Likeness: stocks	Likeness: returns	Raw L/S, avg of 6	CAPM alpha range	Universes alpha t ≥ +2 / ≤ -2
Above 52-week low (this strategy)	momentum	+1.00	+1.00	+7.5%	+5.2% to +13.6%	4 / 0
Momentum 12-1	momentum	+0.63	+0.60	+7.2%	+4.3% to +19.4%	5 / 0
Near 52-week high (mirror)	momentum	+0.51	+0.46	+3.7%	+9.3% to +22.3%	6 / 0
Last month return	short-term reversal	+0.40	+0.46	+1.8%	-3.2% to +11.0%	2 / 0
Residual momentum	momentum	+0.41	+0.44	+6.4%	+8.0% to +12.2%	6 / 0
55-day breakout	momentum	+0.37	+0.41	+1.4%	+4.1% to +13.0%	4 / 0

Signal (top minus bottom, raw sign)	Cluster	Likeness: stocks	Likeness: returns	Raw L/S, avg of 6	CAPM alpha range	Universes alpha $t \geq +2 / \leq -2$
Net tail (MAX+MIN)	tail direction	+0.25	+0.33	-0.9%	-5.2% to +5.2%	0 / 0
MAX5	low risk	+0.27	+0.16	+0.6%	-11.3% to -3.5%	0 / 2
Size	size	+0.07	+0.15	+0.1%	-3.8% to +9.9%	1 / 0
MIN5	low risk	+0.09	+0.14	-0.9%	+2.3% to +13.7%	4 / 0
MAX (best day)	low risk	+0.22	+0.12	+0.1%	-13.3% to -2.0%	0 / 2
Skewness	tail direction	+0.14	+0.12	-0.4%	-6.7% to +3.9%	0 / 2
MIN (worst day)	low risk	+0.06	+0.12	-0.7%	+3.3% to +11.1%	4 / 0
Idiosyncratic vol	low risk	+0.09	+0.07	-3.6%	-15.5% to -4.8%	0 / 4
Volatility (252 days)	low risk	+0.23	+0.04	+2.4%	-12.9% to -4.8%	0 / 3
Volatility	low risk	+0.14	-0.02	+1.1%	-13.7% to -7.9%	0 / 5
Range (MAX–MIN)	low risk	+0.08	-0.02	-0.7%	-15.4% to -4.8%	0 / 4
Same-month seasonality	seasonality	+0.06	+0.01	-1.9%	-9.4% to +6.6%	0 / 1
Beta	low risk	+0.18	-0.01	+4.4%	-12.6% to -4.2%	0 / 4

Spanning. Regressing the L/S on its five closest library neighbours (by return correlation) and the market:

Universe	Alpha after neighbours / yr	t	R ²	Neighbours with $ t \geq 2$
US	+0.0%	0.02	0.70	Momentum 12-1 +0.69 (+7.6), Residual momentum +0.28 (+2.5), Last month return +0.34 (+4.6), Net tail +0.36 (+2.9), Near 52-week high -0.45 (-5.0)
EU	+2.8%	1.07	0.59	Momentum 12-1 +0.61 (+5.6), Last month return +0.46 (+6.2), Residual momentum +0.28 (+2.5), Near 52-week high -0.54 (-4.7)
UK	-0.2%	-0.06	0.52	Momentum 12-1 +0.43 (+3.8), Residual momentum +0.43 (+2.9), Near 52-week high -0.31 (-2.3), Last month return +0.43 (+4.4)
DK	-1.3%	-0.49	0.55	Momentum 12-1 +0.42 (+4.8), Last month return +0.34 (+3.7), Size +0.24 (+3.1)
SCANDI	+1.5%	0.53	0.46	Momentum 12-1 +0.30 (+2.4), 55-day breakout +0.22 (+2.0), Last month return +0.28 (+4.0), Residual momentum +0.30 (+2.5)
World	-0.7%	-0.31	0.63	Momentum 12-1 +0.66 (+4.9), Last month return +0.55 (+7.4), Near 52-week high -0.48 (-3.8)

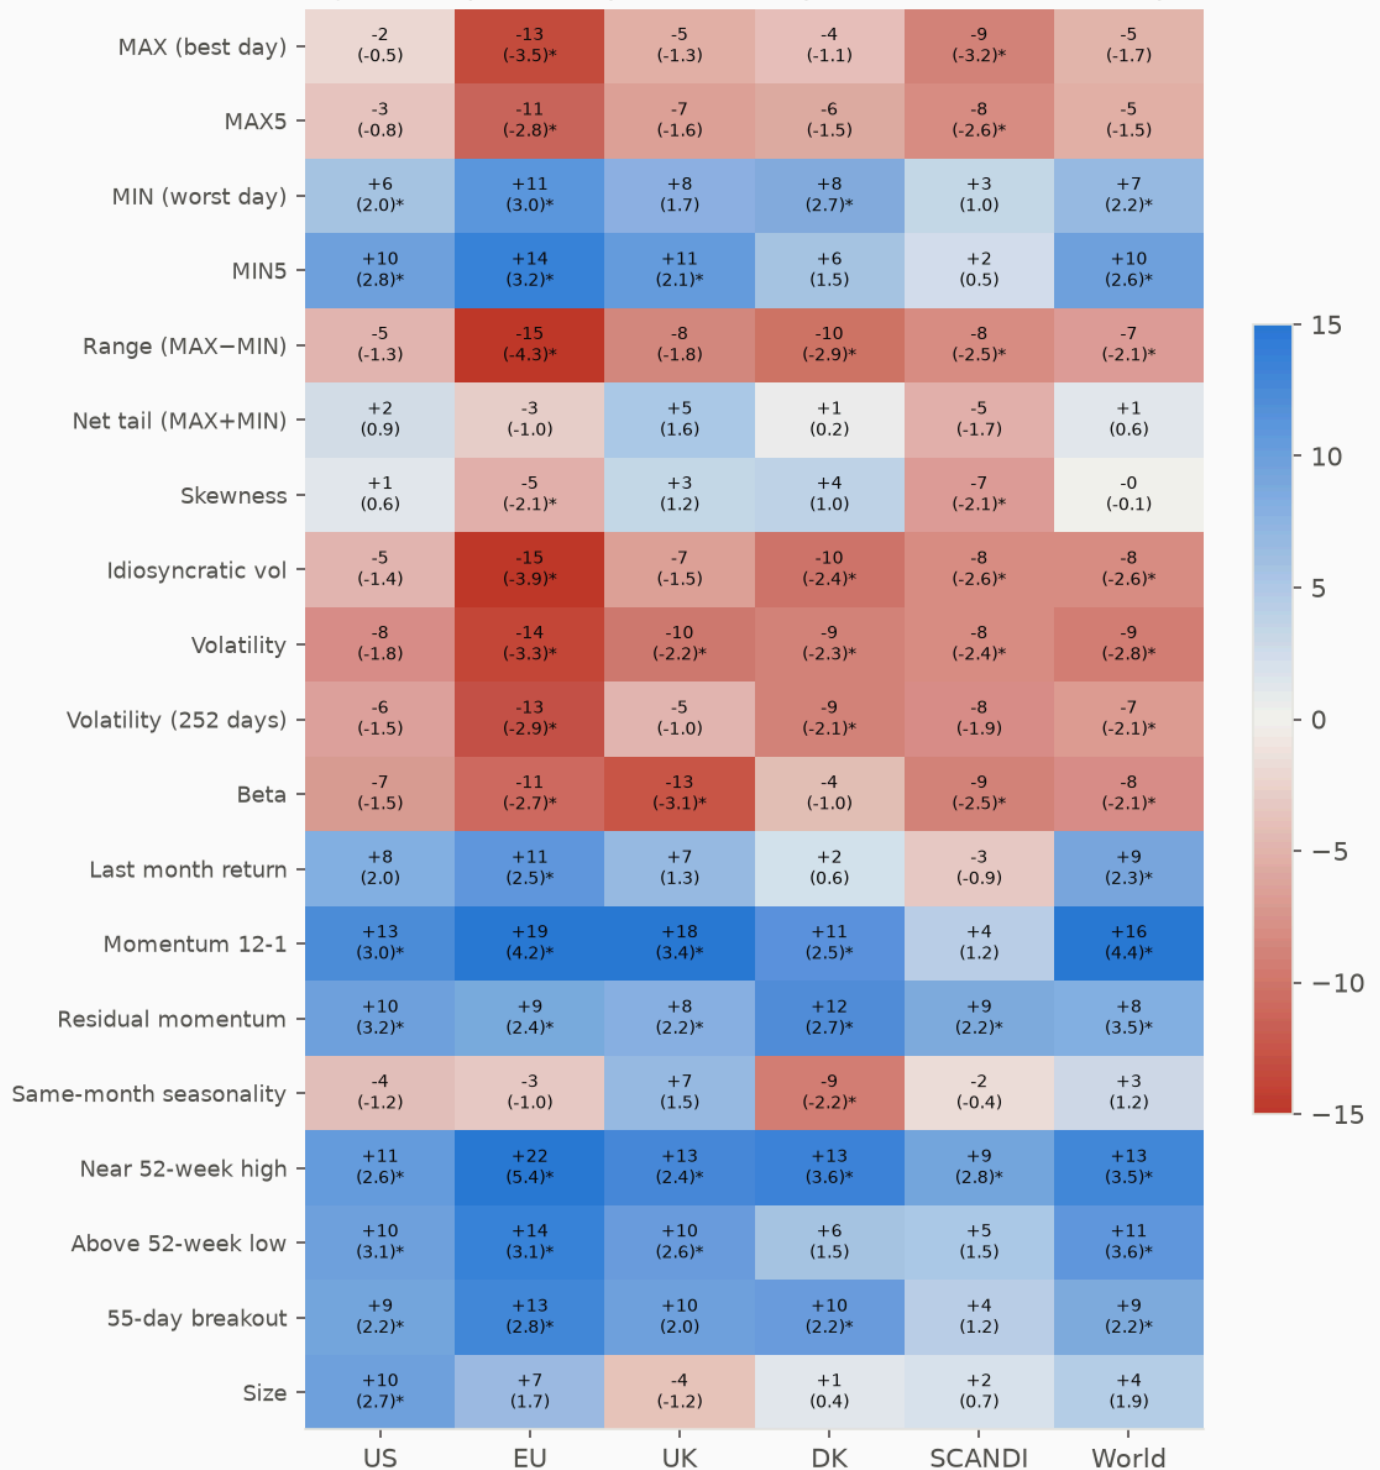

3×3 sort, next-month return a year
(US, EU, UK, SCANDI, World averaged)

low Above 52-week low	9.4%	8.5%	9.8%
middle	11.9%	11.2%	11.8%
high Above 52-week low	12.3%	14.6%	13.5%
	low Near 52-week high	middle	high Near 52-week high

Holding Near 52-week high fixed (down a column), moving from low to high Above 52-week low changes the return by +2.9, +6.1 and +3.7 points a year; holding Above 52-week low fixed (along a row), moving from low to high Near 52-week high changes it by +0.5, -0.1 and +1.2. **Market direction.** Top-minus-bottom return in rising vs falling market months (six-universe average): +5% vs +12% a year. **Horizon:** the gross spread at 1, 2, 3 and 6 months after formation averages +7.5%, +9.8%, +9.6%, +8.8% a year.

The full library, with the CAPM alpha of every signal in every universe:

Signal library: CAPM alpha of each top-minus-bottom sort, % a year (t)

13. Caveats

1. **Residual survivorship.** Point-in-time membership everywhere, but 9–25% of member-quarters outside the US have no price (mostly delisted names); long books are flattered and short books penalised by an unknown amount.
2. **Currency.** Local currency; World sums local-currency returns without conversion.

3. **Equal weighting and flat trading costs.** 10 bp per side for every stock and a size-tiered borrow fee, but no market impact; blue-chip universes only.
4. **Not a registered trial.** Descriptive; the fix ladder is counted inside FSO3–FS12 (25 trials).
